1. Factual Information

1.1. History of Flight

Summary

On January 3, 2004, about 02:45:06 UTC, 04:45:06 Local time, Flash Airlines flight FSH604, a Boeing 737-300, Egyptian registration SU-ZCF, crashed into the Red Sea shortly after takeoff from Sharm el-Sheikh International Airport (SSH) in South Sinai, Egypt. The flight was a passenger charter flight to Charles de Gaulle Airport (CDG), France with a stopover in Cairo international Airport (CAI) for refueling. Flight 604 departed from Sharm el-Sheikh airport with 2 pilots (Captain and First Officer), 1 observer, 4 cabin crew, 6 off-duty crew members and 135 passengers on board. The airplane was destroyed due to impact forces with the Red Sea with no survivals.

The airplane had departed from Sharm el-Sheikh runway 22R and was air born at 02:42:33 UTC, approximately 2½ minutes prior to the crash, and had been cleared for a climbing left turn intercept the 306 radial from the Sharm el-Sheikh VOR station located just north of runway 22R. This climbing turn allows departing flights to gain sufficient altitude before proceeding over higher terrain located along the flight path to Cairo. Flight 604 was operating in Egyptian airspace as a charter flight operating under the provisions of Egyptian Civil Aviation Regulations Part 121

History of Flight

In the following history, comments originally in Arabic are translated in to English and appear in *italics*. A complete transcription of the CVR is contained in Exhibit C, CVR Group Factual Report

- Flash Airlines flight 604 Boeing 737-300 scheduling to depart Sharm El Sheikh at 0230 GMT 0430 local time.
- From Cockpit Voice Recorder information the first officer and observer were in the Cockpit at 02:14:30 the Captain was in the cockpit at 02:18:14.
- Load information and flight information were exchanged between the Flight Deck and Cabin Attendants.
- At 02:18:58 before start check list was requested by the Captain and was read by the F/O and responded by Captain and F/O completed at 02:20:17.
- The Cleared to Start checklist was carried out at 02:32:19, the After Start checklist at 02:35:36, and the Taxi checklist at 02:39:55.
- The ATC clearance was delivered at 02:38:15 and read back by F/O as follows:
ATC Flash 604 destination Cairo as filed climb initially flight level 140 1673 on the squawk.
F/O Our clear to destination via flight plan route 140 initially 1673 on the squawk Flash 604 we have total pax135 *God willing*.
- The Take Off checklist was completed at 02:40:05.
- Take off was initiated at 02:41:59 with standard call outs.
- At time 02:42:02 TOGA mode engaged and then disengaged at 02:42:04.
- Aileron movements during T/O roll and lift off were consistent with crosswind.
- At time 02:42:43, as the airplane was climbing through 440 feet the Captain requested Heading Select. The F/O confirmed the command and the FDR records that heading select mode was engaged.
- At time 02:42:48, Captain requested "Level Change"
- At time 02:42:49 the F/O announced "Level Change, MCP speed, N1 armed Sir".
- At time 02:42:59 the F/O announced "one thousand". At the same time, ATC reported the departure time and confirmed left turn clearance. The clearance was acknowledged by the F/O. This was the last ATC transmission from the flight crew. The aircraft rolled to 20° left bank and began a climbing turn.
- The turn continued as the magnetic heading approached 140° (at an altitude of 3600 ft), at which point the bank angle decreased to approximately 5° left bank.
- At time 02:43:19, EgyptAir Flight (MSR 227), a flight from Hurgada inbounds to Sharm el-Sheikh called ATC. Conversations between ATC and MSR 227 continue for approximately 60 seconds.
- At time 02:43:37, the Captain called for the After Takeoff checklist. There was not audible response from the F/O.
- At time 02:43:55, the Captain called "Autopilot". There was no immediate response from the F/O or mode changes recorded on the FDR
- At time 02:43:58, the Captain stated "*Not yet*".

- At time 02:43:59, the FDR recorded the autopilot was engaged, and that the roll mode transition to CWS-R mode. This transition would have resulted in loss of Heading Select Mode
- At time 02:44:00, the F/O stated "Autopilot in command sir".
- At time 02:44:01, the captain stated "EDEELO", (an Arabic exclamation expressing a sharp response of some kind). At the same time, the FDR records momentary aileron surfaces movements. The right aileron deflected to 7.2 degree TEU for one second
- At time 02:44:02, the CVR records the autopilot disconnect warning and the FDR recorded the autopilot disengaged. The aural warning lasted for 2.136 seconds.
- During this time, an increase in pitch and decay in airspeed were observed
- At time 02:44:05, the Captain requested heading select.
- At time 02:44:07, the F/O states "heading select" and the FDR records heading select mode engaging. This mode transition would have resulted in the reappearance of the flight director roll command bar. During this sequence, the aircraft' left-bank continued to decrease at a slow rate until the airplane was briefly wings level.
- Beginning at this time, the FDR records a series of aileron motions that command a right bank and subsequent right turn.
- At time 02:44:18, the captain states "*See what the aircraft did*". At this point the aircraft bank angle was approximately 12° to the right.
- At time 02:44:27, the F/O states "Turning right, sir". Three seconds later, the captain responds "*What*". At the same time, bank angle is 17° to the right and the FDR records the aileron motions to increase the right bank.
- At time 02:44:31, the F/O states "*Aircraft is turning right*". One second later, the captain response "*Ah*"
- At time 02:44:35, the Captain states "Turning right", at this point, the bank angle was 23.6° to the right
- At time 02:44:37, the Captain states – "*how turning right*", bank angle was 29.7
- At time 02:44:41, the Captain states "OK come out". At this point, the bank angle was slightly more than 40° right bank and the FDR records the ailerons returning to just beyond neutral, the high right roll rate stopped and a momentary left roll rate occurred resulting in a slight decrease in the right bank from 43° to 42° before additional aileron movements command an increase in the right bank.
- At time 02:44:41.5, the F/O states "Overbank". The bank angle at this time was just beyond 50° right bank. The airplane reaches its maximum altitude of just over 5460 feet.
- At time 02:44:41.7, the Captain states "Autopilot". He repeats the statement at 02:44:43.4.
- At time 02:44:44, the F/O states "Autopilot in command". No autopilot engagement was recorded on the FDR. The bank angle was approaching 60° right bank. Pitch angle was zero and altitude was 5390 feet.
- At time 02:44:46, the Captain again states "Autopilot".
- At time 02:44:48, the F/O states "Overbank, Overbank, Overbank". The bank angle was approaching through 70° right bank, pitch angle was 3° nose down

and altitude was 5330 ft. Two seconds later, the Captain responds "OK". The FDR continues to record aileron motions that increase the right bank.

- At time 02:44:52.8, the F/O again states "Overbank". Bank angle was approaching 90°, pitch attitude was 23° nose down, and the altitude was 4860 ft.
- At time 02:44:53.4, the Captain responds "OK, come out". The FDR records aileron motions to increase the right bank.
- At time 02:44:56, the F/O states "*No autopilot commander*". Bank angle was 102°, pitch attitude was 37° nose down, and the altitude was 4100 ft.
- At time 02:44:58, the captain states "Autopilot". At the same time, the FDR records a large aileron motion to the left and the airplane begins rolling back towards wings level. The maximum bank angle recorded was 111° right. Pitch attitude at that time was 43° nose down and altitude was 3470 feet.
- At time 02:44:58.8, the observer states "Retard power, retard power, retard power".
- At time 02:45:01.5, the captain states "Retard power", and the FDR records both engine throttles being moved to idle. The bank angle was 51° right bank, pitch attitude was 40° nose down and altitude was 2470 ft.
- At time 02:45:02, the CVR records the sound of the overspeed warning. The FDR records the airspeed as 360 KIAS.
- Recovery from severe Right Bank and nose down pitch continued
- At time 02:45:04.3, the captain states "Come out". Bank angle was 14° right, pitch attitude was 31° nose down, altitude was 760 ft, and airspeed was 407 KIAS.
- At time 02:45:05, the CVR records a sound similar to ground proximity warning.

- A/C impacted the water at 02:45:06 with:

Bank Angle	24.6° to the right
Pitch Angle	24° Nose down
Vert. G. Load	3.9
Speed	416 Kts

1.2. Injuries to Persons

There were no survivors.

Injuries	Flight Crew	Cabin Crew	Passengers	Off-Duty Crew	Total
Fatal	3	4	135	6	148
Serious	0	0	0	0	0
Minor	0	0	0	0	0
None	0	0	0	0	0
Total	3	4	135	6	148

Table 1: Injury chart.

1.3. Damage to Airplane

The airplane was destroyed by impact with the water.

1.4. Other Damage

There was no other damage. Most of the wreckage remains on the floor of the Red Sea at a depth of approximately 1000 meters.

1.5. Personnel Information

Both the Captain and the First Officer were certified under Egyptian Civil Aviation Authority (ECAA).

1.5.1 The Captain

Date of birth: February 26, 1950
Date of hire with Flash Airlines: February 16, 2003
Airline Transport Pilot Egyptian Certificate Number 561(issued December 15, 1984)
Airplane Multi-Engine Land
Airplane Single Engine Land/Commercial Pilot
Limitations: None
Type Ratings: ATR-42, B-737/300/400/500 (issued May 27, 2003), DHC-5 Buffalo, C-130 and Gomhoria
Medical: First Class (issued November 19, 2003)
Limitations: None

Initial Ground School Training: Written Test April 9, 2003
Oral Test May 22, 2003
Initial Simulator Training B-737-300/400/500:
April 28 - May 12, 2003
Initial Proficiency Check B-737-300/400/500: May 12, 2003
Last Proficiency Check B-737-300/400/500: May 12, 2003
Last Line Check: July 23, 2003
Last Recurrent Training: December 16, 2003

FLIGHT TIMES:

Total flight time (hrs/min) ¹ :	7,443:45
Total flight time on B-737:	474:15

Total flight time (hrs/min)³: 788:53

Total flight time B-737: 242:28

Total flying time last 24 hours⁴: 7:15

Total flying time last 30 days: 43:45

Total flying Time 90 days: 61:10

1.5.3 The Observer

The Observer Mahmoud Hanafy was completing his training as a first officer for Flash Airlines. Airline training procedures require a certain amount of observation time prior to serving as an active crew member. The observer was assigned to this flight to observe as a part of that training requirement.

³ Times are calculated for the first officer up until December 31, 2003.

⁴ Times do not include the accident flight.

1.5.4 Maintenance Engineer

Engineer Mostafa Erfan graduated from the National Civil Aviation Training Institute on September 6th 1972. He worked as a mechanic for the Kuwait Airways for twenty years during which he received the following training courses:

- 1- B 747-269B Mechanics Familiarization during the period from Feb 17th 1979 to March 3rd 1979. (Kuwait Airways).
- 2- Airbus Mechanics Familiarization Course during the period from October 6th to October 18th 1984 (Kuwait Airways).
- 3- B767 Mechanics Familiarization A& C Course during the period between February 7th to February 19th, 1987 (Kuwait Airways).

In 1991 he attended the Cessna 188 course at DEVCO training center, and then he got his Egyptian license without type rating (LWTR) No 1525 on August 1st 1992 which is valid until July 27th, 2004.

He joined Flash Airlines two years ago; during these two years he had the following training and exams:

- 1- B737-300 type course at EgyptAir approved training center during the period from December 22nd, 2002 to February 27th, 2003.
- 2- Basic Indoctrination Course during the period from 13-14 June 2003.
- 3- An On Job Training for 9 months on Flash Airlines B737-300 fleet.
- 4- An approval authorization exam for the engine on November 2nd, 2003 and for the airframe November 3rd, 2003.

His approval No: 014 Valid until: July 26th, 2004 Issued on: Nov 28th, 2003
LWTR No: 1525 Valid until: July 27th, 2004 issued on: August 1st, 1992

1.6 Airplane Information

1.6.1 Airplane History

The accident airplane was a Boeing model 737-3Q8 airplane, serial number 26283, and was equipped with two CFM56-3 engines. The airplane was delivered on 22 October 1992 to an aircraft lessor. Since that time, it had been leased to several different operators and had carried US, UK, and Egyptian registration marks. The airplane had been operated by Flash Airlines since June 2001. At the time of the accident, the airplane carried Egyptian registration marks SU-ZCF and had accumulated 25603 flight hours and 17976 cycles.

Aircraft Type	: B737-3Q8
Minimum Crew	: 2 (Pilot and Copilot)
Registration Marks	: SU-ZCF
Serial Number	: 26283
Manufacture Date	: October 1992
Line Number	: 2383
Variable No	: PQ294
Interior Configuration	: Total 148 Economy Class
ECAA Minimum Number of Flight Attendant	: 3

1.6.2 Cockpit Instrumentation

The airplane was equipped with an electronic flight instrument system (EFIS) which provides displays for most of the airplane's navigational systems. The major displays provided by the EFIS are: color displays of pitch and roll; navigational maps; weather; radio altitude and decision height; and autopilot and flight path information. The EFIS also provides displays of: airspeed; ADF/VOR bearings; ILS data; and stall warning information. There are two separate display screens for each pilot, the electronic attitude direction indicator (EADI) and the electronic horizontal situation indicator (EHSI). The EADI is mounted just above the EHSI in front of each pilot. In addition to the EADI and EHSI, each pilot's panel includes an airspeed indicator, a radio digital distance magnetic indicator (RDDMI) which displays directions and distance to radio navigation aids, an altimeter, a vertical speed indicator (VSI), and a clock. See Figure 1.6.2-1 for a simulated view of the captain's panel showing these instruments.

Figure 1.6.2-1 Example Captain's Instrument Display

1.6.2.1 Electronic Attitude Direction Indicator (EADI)

The Electronic Attitude Director Indicator (EADI) provides a multicolor display of airplane attitude, airspeed, flight director commands and various other data. The primary display is an artificial horizon which depicts the pitch and roll of the airplane. The artificial horizon line which separates the upper blue portion of the display from the lower brown portion moves up and down as the airplane pitches and tilts. The display is designed such that the artificial horizon line that appears on the display is always parallel with the real horizon. Pitch and roll data for the captain's and first officer's EADI are supplied by separate left and right inertial reference units. In independent standby attitude indicator is installed on the captain's panel inboard of the EADI. In addition to attitude information, the EADI displays a moving airspeed scale along the left side and ground speed in the lower left corner. The upper portion of the EADI is called Flight Mode Annunciator (FMA). This area is used to display the current operating modes of the autoflight system to the crew. The FMA is separated into four separate areas in which are displayed (from left to right), the autothrottle mode, pitch mode, roll mode, and autopilot mode. See section 1.6.4 for further information about the autopilot and flight director.

An example EADI screen is shown in Figure 1.6.2.1-1.

Figure 1.6.2-2 Example EADI Display – In this example, the airplane is pitch is 7.5 degrees above the horizon and the roll angle is 20 degrees to the left, airspeed is 220 knots, ground speed is 238 knots, the autopilot mode is "N1", the pitch mode is "MCP Speed", the roll mode is "heading select", and the autopilot mode is "Flight Director"

1.6.2.2 Electronic Horizontal Situation Indicator (EHSI)

The EHSI provides horizontal navigation information to the flight crew. There are a number of display formats available which can be separately selected by the flight crew. On the accident flight, both the captain and first officer were using the expanded VOR display which is described below

Figure 1.6.2-3 Example EHSI Display – Expanded VOR Mode – Flag notes denote various options

1.6.3 Lateral Flight Control System

Lateral control is provided by an aileron and two flight spoilers on each wing which are controlled by either control wheel in the flight deck. A pair of cables transfers motion of the control wheels to motion of an aft quadrant located near the main landing gear wheel well.

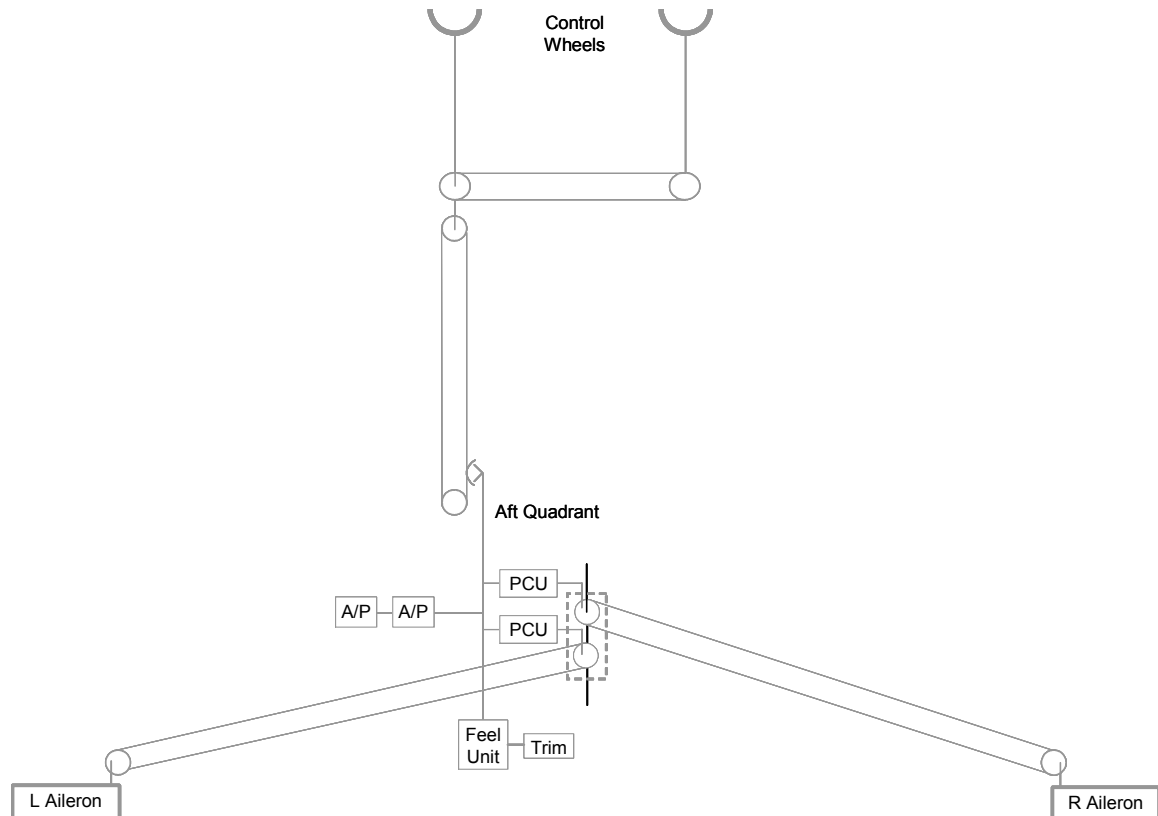

Figure 1.6.3-1 Simplified Lateral Control System Schematic – Additional cable runs, jam protection features, and spoilers not shown

The aft quadrant is connected to the control valves of two independent hydraulic power control units. Either unit alone is capable of providing full-range lateral control. Artificial feel and wheel centering for lateral control is provided by the feel unit which consists of a centering cam, roller, and spring. Aileron trim is accomplished with aileron trim switches on the aft end of the pilots' control stand. The trim switches command an electro-mechanical linear actuator which repositions the feel and centering mechanism.

Two flight spoilers on each wing operate in conjunction with the ailerons through a spoiler mixer mechanism connected to the aft quadrant.

Two autopilot actuators are connected to the aft quadrant. Either or both of the autopilot actuators can move the aft quadrant, resulting in movement of both the control wheels and the ailerons. One feature of the lateral control system is that the position of the ailerons always corresponds to the position of the wheel. Even if aileron trim or the autopilots are in use, the relationship between the position of the control wheels and the position of the aileron is unchanged.

1.6.4 Autoflight System

The digital flight control system consists of a centrally located mode control panel (MCP), two independent flight control computers (FCCs), two aileron autopilot servo actuators, and two elevator autopilot servo actuators. Together, these components provide the functions of the autopilot and flight director. The MCP, located above the pilot's front panels and below the windows, provides a centralized location for all autopilot, flight director and autothrottle control selections. The FCCs receive flight crew requests and airplane sensor inputs which are used to generate flight director displays and, if the autopilot is engaged, command flight control surfaces.

1.6.4.1 Autopilot System

Each of the two FCCs provides an independent autopilot and are designated A and B. Each FCC is connected to one aileron and one elevator servo actuator. The autopilot is engaged by selecting the appropriate push button on the MCP. If certain required conditions are met, the selected autopilot will synchronize the roll channel autopilot servo to the current position of the ailerons. Following synchronization, the autopilot servo will clamp onto the aft quadrant and begin moving the ailerons (and control wheel) in response to the flight path selected by the crew. A similar process occurs in the pitch channel.

During cruise, only a single autopilot is used. If the second autopilot is selected, the first autopilot is disengaged when the second autopilot engages. During approach, both autopilots may be used together for two channel operation.

Engage Switches:

The pushbuttons are normally-open, momentary contact switches which control an engage relay by means of electronic circuitry. Either channel can be engaged in CWS or CMD by pressing the appropriate switch. A light illuminates on the switch to indicate that the autopilot has been engaged, and each switch may be disengaged by pressing the switch again. Loss of power (28v) or ground to the relay will cause it to de-energize and the pushbutton switch light will go out. If CWS or CMD is pressed while either power or ground for the relay is not provided, the relay will not energize and the pushbutton light will not illuminate.

Autopilot Actuators: (Figure 1.6.3-1)

A- Four autopilot actuators are installed, two in the main wheel well area for the aileron axis and two in the aft fuselage for the elevator axis. One set, aileron and elevator, is controlled by the A autopilot system and the other set by the B autopilot system. The units are mechanically linked to aileron and elevator power control units (PCU's) which drive the flight control surface

B- A pressure switch is installed on each actuator. The switch closes when normal hydraulic pressure is applied to the PCU. The engage interlock voltage is wired through the switches.

C- Autopilot system electrical signals operate valves which modulate hydraulic pressure to displace a hydraulic piston and provide a rotary output to the respective PCU. Control and position signals are provided by the following components which re installed on each actuator: engage solenoids, transfer valve, linear variable displacement transducer (LVDT), and pressure regulator.

1- Engage Solenoids

Two engage solenoids are on each autopilot module. Each solenoid is an electrically operated valve (28 volts dc) which, when energized, applies hydraulic pressure within the module. The ACTUATOR solenoid provides hydraulic pressure to the TRANSFER VALVE and to the DETENT SOLENOID. The detent solenoid provides hydraulic pressure to the detent mechanism. Both solenoids are energized at A/P engagement. However, the detent solenoid is delayed slightly from the ACTUATOR solenoid. The solenoids are attached to the module with four bolts. Electrical pins mate with wiring within the module when the units are installed. Hydraulic pressure is powered into the units through ports which align when the solenoids are installed.

2- Linear variable displacement transducer (LVDT)

The linear variable displacement transducer provides positional information for the actuator piston and provides an ac output signal in proportion to piston position.

3- Pressure regulator

The pressure regulator is in line with the hydraulic passages between the detent solenoid and the detent piston (which locks the actuator piston to the output crank). The regulator bypasses hydraulic fluid to limit the output force (autopilot authority) of the actuator when the unit is backdriven or stalled

Autopilot Servo Schematic

Figure 1.6.4-1 Autopilot Actuator

1.6.4.2 DFCS Modes

Various pitch and roll modes are available and can be manually selected by the flight crew via the MCP. In some cases, automatic mode changes can occur in response to invalid sensor inputs, certain flight conditions, or selection of other compatible modes. During the accident flight, the following modes were used:

Take-Off

Flight director guidance during takeoff is initiated by pressing the take-off/go-around (TOGA) switches located on the throttles. In addition to selecting flight director TOGA mode, these switches also signal the autothrottle to advance the throttles to takeoff power. In TOGA mode, the flight director provides pitch and roll guidance to the crew. If TOGA is engaged, no other modes may be selected until an altitude of 400 ft AGL.

Level Change

Level Change is an autopilot and flight director pitch mode during climb or descent. In this mode, a fixed thrust level is selected and the autopilot will control the angle of climb or descent to hold the airplane's speed to the value selected in the speed window on the MCP. If the airplane is flying faster than the selected speed, the autopilot will command the airplane to pitch nose up to a steeper climb angle, thus lowering the speed. If the airplane's speed is slower than the selected speed, the autopilot will command the airplane to pitch nose down to a shallower climb angle, which will result in a speed increase. When Level Change mode is selected, "MCP SPD" appears in the pitch section of the flight mode annunciator (FMA) on the EADI. As the airplane nears the selected altitude, the autopilot will automatically transition to altitude acquire ("ALT ACQ" on the MCP) and then altitude hold ("ALT HOLD"). Level Change is available for both autopilot and flight director operation.

Heading Select

Heading select is an autopilot and flight director roll mode used to turn to and hold a specific heading. The MCP contains a selected heading window, as well as a bank angle limit selector. The window displays the selected heading, a number from 0 to 359, corresponding to the magnetic heading selected by the crew. The value can be changed by rotating the heading selector knob located immediately below the window. A bank angle limit selector is concentrically located on the same shaft. In Heading Select, the crew can select the bank angle of autopilot turns from 10° to 30° by 5° increments. When heading select mode is engaged, the autopilot will command a turn towards the selected heading. The airplane will bank to the selected bank angle limit and will remain at that limit until the current heading begins to approach the selected heading. As the turn nears completion, the bank angle is reduced until the airplane is flying wings level on the selected heading. The direction of turn is determined to be the shortest turn between the current heading and the selected heading. If the airplane is already in a turn and the selected heading is changed to pass through the reciprocal bearing (greater than 180°), the direction of turn will reverse and the autopilot will seek the shortest turn to reach the selected heading. Heading select is active when "HDG SEL" appears in the roll section of the FMA and is available during both flight director and autopilot operation.

Control Wheel Steering - Roll

Control wheel steering roll (CWS R) is a separate autopilot roll mode designed to reduce crew workload. CWS R mode may be manually selected via the CWS pushbutton on the MCP. In this case, flight director modes may be selected via the mode selection push buttons on the MCP. If certain conditions required for other roll modes are not met or if a certain amount of force is applied to the control wheel, the autopilot mode will automatically change from CMD to CWS R.

In CWS R, the autopilot commands the aileron servo to follow the motions of the control wheel. If the pilot releases the control wheel, the autopilot provides aileron commands to hold the current bank angle and thereby continue the commanded turn. However, if the bank angle when the wheel is released exceeds 30°, the autopilot will command a roll back to a bank angle of 30°. If the bank angle when the wheel is released is less than 6°, the autopilot will command wings level and maintain the current heading. CWS R is active when "CWS R" appears in the autopilot section of the FMA. When the autopilot enters CWS R mode, the roll section of the FMA will be blank and the flight director roll command bar disappears. However, other roll flight director modes may subsequently be engaged.

MCP Speed

MCP speed is a pitch mode of the autopilot that is used when climbing or descending. In this mode, a fixed thrust level is selected and the autopilot will control the angle of climb or descent in order to hold the airplane's speed to the value selected in the speed window on the MCP. If the airplane is flying faster than the selected speed, the autopilot will command the airplane to pitch nose up to a steeper climb angle, thus lowering the speed. If the airplane's speed is slower than the selected speed, the autopilot will command the airplane to pitch nose down to a shallower climb angle, which will result in a speed increase. MCP speed mode is active when "MCP SPD" appears in the pitch section of the flight mode annunciator (FMA) on the EADI.

1.6.4.3 Flight Director

The flight director is provided as an aid to the crew during manual flight and as a way for the crew to monitor the operation of the autopilot. The flight director consists of pitch and roll command bars which appears as horizontal and vertical magenta lines on the EADI respectively. When the airplane is following the flight path selected on the MCP, the flight director bars will be centered on the EADI display. If the airplane is flying below the selected path, the horizontal pitch bar will begin to rise on the display, indicating that a nose up command is required to regain the path. As the airplane regains the selected path, the command bar returns to the centered position. Similarly, if the airplane is following the selected roll path, then the vertical roll command bar will be centered. If the airplane deviates to the right of the selected path, the roll command bar will deviate to the left indicating that a bank to the left is required. It should be noted that the flight director roll command bar indicates the additional bank that is required to fly the selected path. For example, with the bank angle limit set to 20 degrees, if the airplane is in a 20 degree right bank as part of a 90 degree right turn, the flight director bar will be centered on the display because the airplane is on the desired path (in this case a 20 degree bank turn). As the turn continues and the airplane approaches the selected heading, the flight director bar will begin to move to the left indicating that the airplane should begin rolling left, out of the turn, and back towards wings level.

1.6.5 Engines:

General:

The airplane is powered by two CFM56-3C1 engines (Serial numbers are: “engine #1” 857 352, “engine #2” 856 481. The engine is a dual rotor axial flow turbofan. The N1 rotor consists of a fan, a three stage booster section connected by a through shaft to a four stage low pressure turbine. The N2 rotor consists of a high pressure compressor and a high pressure turbine. The N1 and N2 rotors are mechanically independent.

The main engine control (MEC) schedules fuel to provide the thrust called for by the forward lever setting. The fuel flow is further refined electronically by the power management control. Thrust is set by positioning the thrust levers. The thrust levers are positioned automatically by the autothrottle system or manually by the flight crew. The forward thrust levers control forward from forward idle to maximum. The reverse thrust control thrust from reverse idle to maximum reverse. Engine indications are displayed on the center instrument panel by the Engine indication System (EIS). N1, EGT, N2, and FF/FU are the primary indications and are displayed as both digital readouts and round dial/ moving pointer indications. N1, EGT, N2 have operating and caution ranges and limits indicated by green and yellow bands and red dials. Oil Pressure and oil temperature indications are displayed with a round dial/moving pointer. Operating and caution ranges and limits are displayed with green and yellow bands and red dials. The oil quantity indicator displays a digital readout of quantity as a percentage of full

The low pressure spool (fan) rotating speed (N1) of the left engine (position 1) does not appear representative of the high pressure spool (core) rotating speed and fuel flow on the DFDR read out; however, the indicated core speed is working as well as the other parameters, which indicate most probably a data recording or read out problem for N1. (refer to Exhibit B FDR Group Factual Report)

1.6.6 Airplane Maintenance⁵

1.6.6.1 Maintenance Records

1.6.6.1.1 Maintenance Program Summary- Flash Airlines B737-300

Flash Airlines has developed their customized Maintenance Program. The Maintenance Program last revision was issued on January 20, 2003 and approved by the (ECASSA), Airworthiness Central Administration under approval No MOCA/FLASH/737-300/MP/R2/03. This Maintenance Program incorporated guidance from Boeing Maintenance Planning Document (MPD) Revision July 2002.

The Periodic Service Check is accomplished on layover. The check is performed as a walk-around, visual inspection and servicing when necessary.

The Routine Inspection is performed every 250 flight-hours (A Checks). A Routine Inspection Procedures Index is used to assure the check is completed. The Inspection consists of a visual inspection of the aircraft's major components, servicing, operational and functional checks.

1.6.6.1.2 Last Heavy Check

The last "A" check accomplished by Flash Airlines and the last "C" check and Structural inspection carried by Braathens Engineering and Maintenance for the SU-ZCF were as follows:

"8A" Check	:	December 12, 2003	at 25423:50 Flight Hours
"7C" Check	:	From Nov 3 - Dec 21, 2002	at 23531 Flight Hours
Last SI Check	:	From Nov 3 - Dec 21, 2002	at 23531 Flight Hours
Last 15 M Check:		From Nov 3 - Dec 21, 2002	
Last 45 M Check:		From Nov 3 - Dec 21, 2002	

1.6.6.1.3 Repairs and Alterations

⁵ See the Maintenance Records Group Report for full details

1.6.6.1.4 Aircraft Total Hours and Cycles

Total Hours at Time of Accident: 25603 Flight Hours
Total Cycles at Time of Accident: 17976 Flight Cycles

1.6.6.1.5 Weights and Balance Summary

According to the Egyptian Civil Aviation Regulations, ECAR 91 Appendix H attachment 1 the aircraft has to be reweighed every three years. Furthermore, aircraft must be reweighed if the effect of modifications on the mass and balance is not accurately known. Flash Airlines aircraft was weighed last time on December 19, 2002 in Braathens SAFE, Stavanger, Norway and recalculated by Flash Airlines after the reinforced cockpit door modification installation on November 1st, 2003, and the results were as follows.

Empty Weight : 70794 lbs
Moment : 45921358.6 lb.in
% AMC : 17.42%

1.6.6.1.6 Engines: CFM56-3C-1

Engines are maintained in accordance with Flash Airlines Maintenance program and are based on the life cycle limits of the rotating components. CFMI Engine maintenance manual together with the applicable Service Bulletins and engine teardown data determine these limits. Overhauls are performed at the SNECMA MOROCCO Workshop or other authorized Certified Repair Station.

	<u>Engine Position 1</u> (Left Side)	<u>Engine Position 2</u> (Right Side)
Serial Number (ESN)	857352	856481
Time Since New (TSN)	25314 hours	26045 hours
Cycles Since New (CSN)	17815 Cycles	17523 Cycles
Date of Installation on SU-ZCF	August 1998	Jan 3, 2003
Time Since Last O/H	8741 Hours	1828 Hours
Cycles Since Last O/H	6188 Cycles	909 Cycles

Engine Disks and First Limiters Status as per attached (refer to exhibit A, Maintenance Records Group Factual Report- attachment 02)

1.6.6.1.7 Engine Monitoring System

Flash Airlines engines are monitored as per the manufacturer (CFMI) engine condition monitoring program (Sage Trend Analysis program). Sage is a set of programs which collectively provide the functionality to perform standard condition

monitoring of CFMI engines. Sage is designed to work in an interactive environment with the major analytical calculations performed at scheduled times throughout the day.

By reviewing the engine condition monitoring trend reports for both engines, they showed no deviation or important shift, the EGT margin is considerable ok. Engine Condition Monitoring cruise trend sheet is attached (refer to exhibit A, Maintenance Records Group Factual Report- attachment 14)

1.6.6.1.8 Flight Data Recorder/ Cockpit Voice Recorder.

Description	P/N	S/N	Test Date	Workshop
Sundstrand FDR Transport Avionic	980-4120-DXUN	10069 O/H	18/11/02	Air
CVR Braathens	93A100-80	57994	Tested 12/11/02	

1.6.6.1.9 Aircraft Status

1.6.6.1.9.1 Minimum Equipment List (MEL)

Flash Airlines Customized Minimum Equipment List CMEL was approved by the ECAA on Feb 23rd, 2002.

1.6.6.1.9.2 Aircraft Condition Report (A/C deferred defects)

No deferred items were recorded in the aircraft deferred snags log Book

1.6.6.1.9.3 Type Certificate Data Sheet

FAA "Type Certificate Data Sheet" number A16WE (revision 28, dated October 29, 1999) for B737-300 series airplanes was reviewed for compliance conditions and limitations. No discrepancies were noted. Type certificate Data Sheet attached (refer to exhibit A, Maintenance Records Group Factual Report- attachment 15).

1.6.6.1.9.4 Supplemental Type Certificates

Supplemental Type Certificates supplied by Flash Airlines were reviewed. One Supplemental Type Certificate was issued to install a Matsushita Audio Entertainment System in accordance with General Aerospace Engineering Order No GA-23-1042. STC attached (refer to exhibit A, Maintenance Records Group Factual Report- attachment 16).

1.6.6.1.9.5 Airworthiness Directives (AD) Summary and Service Bulletins (SB) Summary

The Airworthiness Directives compliance status list dated January 12th, 2004 (attachment 03) submitted by Flash Airlines was reviewed with special concentration on AD's carried out after the aircraft was leased by Flash Airlines.

The previous AD's Status which was forward to Flash Airlines during the aircraft delivery was reviewed with special attention to those AD's which had an open or repetitive status.

All listed Airworthiness Directives and Service Bulletins have been complied with no discrepancies noted.

Service Bulletins compliance status attached ((refer to exhibit A, Maintenance Records Group Factual Report- attachment 17).

1.6.6.1.9.6 Prior Discrepancies/Accidents Involving SU-ZCF

Per Flash Airlines records, no previous accidents were reported for the accident aircraft.

1.6.6.1.9.7 Logbook Forms

- The original aircraft Technical Log Book sheets were reviewed for the last three months from September 27, 2003 through December 2003 for discrepancies, no trends or discrepancies noted.
- Copy of the technical log book sheets listing as well as a list of technical log book entries and relevant corrective actions are attached to "Exhibit A Maintenance Records Group Factual Report"

1.6.6.2 Contracted Repair Station Listing

- EgyptAir Maintenance and Engineering
- Braathens Maintenance and Engineering
- Snecma Morocco Engine Services.

1.6.6.3 Maintenance Performed on the A/C before the accident flight.

A. Maintenance done by Flash Airlines Tech Staff at Cairo Base

The Last Check carried out on the accident aircraft was an 8A check. The check was performed by Flash Airlines Technical staff at Cairo base station. The check work package included visual inspection, servicing, and operational checks. A routine borescope inspection for the HPT nozzles guides vanes and the combustion chamber was performed on both engines by EgyptAir with no findings. The work package was reviewed with no discrepancies.

B. Transient Check carried out for the Flight VCE/SSH

A transient check was carried out in VCE by engineer Motaz Awad on January 2nd, 2004 a copy of the interview with him is attached

C. Last PDC carried out for the Accident Flight

On January 3rd, 2003, aircraft SU-ZCF, a daily check was performed in accordance with the approved checklist as per the company maintenance schedule at SSH station just before the flight. The check was carried out by the accident flight on board engineer.

D. Aircraft refueling before the Accident Flight and investigations done after the accident.

The Refueling was done for the accident aircraft on January 3rd, 2004 between 03:50 and 04:00 local time (UTC +2) for the quantity of 3500Liters by truck no 4432 belonging to Misr Petroleum Company (service invoice is attached) (refer to exhibit A, Maintenance Records Group Factual Report- attachment10)

The same truck had refueled the following airplanes on the same date:

- EgyptAir aircraft A320 SU-GBF at 02:05 LT before the accident aircraft.
- Taroum aircraft YR-GGX at 04:20 LT after the accident aircraft.
- EgyptAir aircraft SU-GCD at 05:10 LT after the accident aircraft.

After the aircraft accident, three fuel samples had been drawn from the Misr Petroleum fuel truck on January 3rd, 2004 at 12:45 local time. One of them was used for a dehydrated Copper Sulfate capsule field inspection for fuel water content, which was satisfactory (attachment 11). The two others samples were sent to the following laboratories for analysis:

- The Egyptian Petroleum Research Institute Nasr City, Cairo (refer to exhibit A, Maintenance Records Group Factual Report-attachment 12)
- Misr Petroleum Company, Ghamra Research Center Laboratory (refer to exhibit A, Maintenance Records Group Factual Report- attachment 13)

The Egyptian Petroleum Research Institute (EPRI) performed the Jet (A-1) fuel analysis, ASTM distillation and ASTM D-86. The results of these analyses show that all the values are within limits except for the water content, ppm, which is 48, and the max is 30.

The Misr Petroleum Co, Ghamra Research Center Laboratory performed the same analyses done by (EPRI), all the results comply with the requirements of DES-STAN 91-91 issue 4 (DERD 2494) and the joint fueling systems “Checklist” specifications for JET A-1 issue 19 Sept, 2002.

1.6.7 Weight and Balance:⁶

The Flash Airlines weight and balance calculations provided to the flight crew contained the following information⁷:

	Weight (kilograms)	
Total Traffic Load	11,450 ⁸	
Dry Operating Mass	33,200	
Actual Zero Fuel Mass	44,650	
Maximum Zero Fuel Mass	47,627	
Takeoff Fuel	7,000	
Actual Takeoff Mass	51,650	
Maximum Takeoff Mass (Certificate Limi	63,276	
Landing Mass	49,650	
Maximum Landing Mass (Certificate Limi	51,709	

Zero Fuel Mass Center of Gravity (CG)	20.0%	
Zero Fuel Mass CG Limits ⁹	8.0% Forward	28.4% Aft
Takeoff Mass CG	18.0%	
Takeoff Mass CG Limits ¹⁰	6.7% Forward	27.9% Aft

Stabilizer Trim settings for takeoff were:

Flaps 1 or 5 4 ¾ Units
 Flaps 15 3 ¾ Units

According to the Flash Airlines Flight Operations Manual Chapter 6, Paragraph

6.1.8.3, Passenger and Baggage Masses, the following chart was published:

⁶ See attached Performance Factual Report

⁷ See attached Flash Airlines Load and Trim Sheet.

⁸ A review of the Load and Trim Sheet indicated a low 100-kilogram error. The total cargo weight plus passenger mass (Total Traffic Load) should be 11,550 kilograms. Correspondingly, the Zero Fuel Mass, Takeoff Mass, and Landing Mass will be low in error by the same 100-kilogram Mass.

⁹ Estimated Zero Fuel Mass CG limits were derived from Flash Airlines Load and Trim sheet index chart based upon a Zero Fuel Mass of 44,650 kilograms.

¹⁰ Estimated Takeoff Mass CG limits were derived from Flash Airlines Load and Trim sheet index chart based upon a Takeoff Mass of 51,650 kilograms.

	Male	Female
All flights except	88kg	70kg
Holiday	83kg	69kg
Children	35kg	35kg

A review of the accident Load and Trim Sheet indicated a Passenger Mass of 9,450kg. If 350kg is removed for 10 children (10 x 35kg) the result is 9,100kg. Dividing the 125 adult passengers into the 9,100kg would give an average value of 72.8kg per adult passenger.

Using the table above, and assuming 50% Male and 50% Female adult passengers, the worst-case difference in weight calculation would be the following:

The average weight of male and female for all flights except would be $88\text{kg} + 70\text{kg} / 2 = 79\text{kg}$ per adult passenger.

$$79\text{kg} \times 125 \text{ passengers} = 9,875\text{kg}$$

This represents an increase in weight of 775kg.

Using this value for Load and Trim calculations provided the following information:

Takeoff CG 18.2%MAC
Zero Fuel Mass CG 20% MAC
Takeoff Trim (flaps 5) 4 ¾ Units

These worst-case differences in values for passenger weight still fall within structural and calculated limitations for the airplane.

Fig 1.6.5-1 Copy of the Accident Flight Load Sheet

1.7 Meteorological Information: ¹¹

Sharm El Sheikh does not provide Automatic Terminal Information Service (ATIS).

The SSH weather at 0200Z was reported as:

270 degrees at 06 knots, ceiling and visibility OK (CAVOK)¹², temperature 17 degrees Celsius, dew point minus 6 degree Celsius, altimeter 1011 HectoPascals (hPa), No significant change (NOSIG)¹³.

The SSH weather at 0300Z was reported as:

280 degrees at 08 knots, ceiling and visibility OK (CAVOK) temperature 17 degrees Celsius, dew point minus 6 degree Celsius, altimeter 1011 HectoPascals (hPa), No significant change (NOSIG).

¹¹ Refer to exhibit D, Airplane performance Group Factual Report

¹² CAVOK, this terminology means ceiling above 5000 ft and visibility above 10 kilometers.

¹³ NOSIG, this terminology means no significant change expected

1.10. Aerodrome Information

According to the Aeronautical Information Publication (AIP), Sharm el-Sheikh International Airport is located 23 kilometers northeast of the city. The elevation of the airport is 143 feet mean sea level. The airport had two paved parallel runways; 04L-22R and 04R-22L. Both runways were 3081 meters in length and 45 meters in width. Runways 04R and 04L have CAT 1 Approach Lighting System and runways 22R and 22L had Simple Approach Lighting System. Neither runway had runway centerline lights.

According to the AIP Flight procedures, there was no standard departures and standard arrival routes or any other systematic procedures established within Sharm el-Sheikh approach airspace, heading, flight level, speed and or holding instructions shall be specified in approach control clearances to arriving and departing flights as appropriate to meet the requirements of traffic conditions.

Air Traffic Control Services for Sharm el-Sheikh

An Interview with the Director of Radar Airports, National Air Navigation Service Company indicated that at SSH, the local controller and the departure controller were the same person. The previous last flight departure before the accident flight departed about one hour earlier. An arrival flight landed less than 10 minutes after the accident flight departed. Radar was operating but no radar service was provided to the accident flight.

According to the Director, there were no Standard Instrument Departures (SIDs), or Standard Terminal Arrival Routes (STARs) in Egypt. Clearance was provided to the accident flight crew while on the ground and the departure included a left turn at pilot's discretion and to climb to Flight Level (FL) 140 and to intercept the 306 VOR radial. MEA for this sector is 10500 ft.

According to the Director, the prevailing winds at SSH require the use of runway 04L 70%-80% of the year. On the date of the accident, runway 04L was being used. However, sometime during the day prior to the accident, the runway was changed to 22R.

There was no inspection of the runway after notification of the accident, however, it was stated that the landing airplane after the accident did not report debris on the runway. There is a daily runway inspection performed at SSH.

For AIP information, see attachment

1.11. Flight Recorders

1.11.1. Flight Data Recorder¹⁵

The accident airplane's flight data recorder (SSFDR), part number 980-4120-DXUN S/N 10069, was retrieved from the Red Sea on January 16, 2004 by the French Navy. The FDR was immersed in water and sealed in an ice chest and transported to MCA, accident investigation laboratory at Cairo.

- Readout of the FDR was accomplished using the laboratory's playback hardware, Hand held Down Load unit manufactured by ALLIED SIGNAL Part No. 964-0446-001 and recovery/ analysis/ presentation system (RAPS) software.
- In spite of the damage that had occurred to the external case of SSFDR, the internal solid state memory was in good condition and all the available data was retrieved. RAPS considered the recorded signal and data quality to be very good.
- Data plots and tabular listings of each data parameter for the entire accident flight are included in this report as Appendix "exhibit B, FDR Group Factual Report". The entire 25-hour contents of the FDR were also transcribed,

After the cockpit voice recorder (CVR) timing had been compared to the SSFDR vhf microphone keying and Autopilot disengages warning, a time correlation was developed. (refer to exhibit B, FDR Group Factual Report)

¹⁵ See FDR Group Factual Report

1.11.2 Cockpit Voice Recorder¹⁶

- The accident airplane's Cockpit Voice data recorder (CVR), Fairchild, Part no. 93-A100 – 80, serial no. 57994 was retrieved from the Red Sea on January 17, 2004 by the French Navy. The CVR was immersed in water and sealed in an ice chest and transported to MOCA, accident investigation laboratory at Cairo.
- Readout of the CVR was accomplished using the laboratory's playback hardware and software as follow:

Download Unit:

A100 CVR play back Deck - Store 4DS

Audio Analysis System:

MPL 1024 , 12 Channel Microphone Mixer – Samson

Filter : PCAP II (Samson)

Amplifier : Samson - Servo-550 Studio Amplifier

Software:

Vegas 4 – Sound Forge 6 –PCAP II

- The recorder consisted of four channels of audio information.

Channel One:	First officer hot mic.
Channel Two:	Area Mic.
Channel Three:	Observer hot Mic..
Channel Four:	Captain hot Mic..
- After the initial retrieved sound task was completed another effort was undertaken with the assistance of BEA expert as follows:
 - The output signal from the tape deck playback machine was too low compared to the recording on the same conditions in BEA. This problem was solved by increasing the output level when the screw of the adjustable gain control was turned clockwise.
 - The sensitivity of the acquisition audio card of the PC was not good enough to capture correctly the audio signal coming from the tape deck player. This problem was solved by changing the value of the “Variable Signal Levels” on the hardware setting of the audio card, from the manufacture value +4 to -10. The gain was increased and the input signal amplified.
 - The speed of the tape was not correct with an interference of the power (115 V, 400 Hz) measured at 375 Hz. It was not possible to adjust properly the speed of the tape with the device

¹⁶ (refer to exhibit C, CVR Group Factual Report)

installed. This problem is solved by resampling the wave file with a correct ratio ($400/375= 1.0665$).

- Some high frequencies were missing when doing the spectrum analysis. This problem was solved by using a sampling rate of 32000 kHz instead of 22000 kHz.
- The alignment of the head installed on tape deck player was checked, adjusted and was found satisfactory prior to playback the tape.

A new copy of the CVR was performed. This recorded copy is satisfactory.

1.12. Wreckage and Impact Information:¹⁷

1.12.1 Scope of Site and Wreckage Group Field Notes

The scope of this report is the recovery operations that took place from 3 January 2004 through 5 February 2004 in the Red Sea off Sharm el-Sheikh, Egypt and initial inspection for the recovered parts. Recovery operations initially consisted of the recovery of floating wreckage elements only. Recovery of the underwater wreckage (including FDR and CVR) began when the first ship equipped with a suitable Remote Operated Vehicle (ROV), arrived at the accident scene on 11 January 2004.

This report provides a summary of the recovery operations and documents the wreckage that was identified and recovered.

1.12.2 Recovery Operations

Survival aspects

The initial search for possible survivors and the recovery of bodies were priorities for the rescue and investigation teams. Rescue teams were on site minutes after the accident. They searched for survivors but due to the high energy impact of the aircraft with the sea surface, the depth of the water in this area, their efforts were unsuccessful in recovering any survivors.

Efforts were made to locate human remains by use of deep sea cameras and robots but were also not successful due to the location of the wreckage and the depth of more than 1000 meters.

Floating Wreckage

Figure 1.12.4-1 Water depth map

¹⁷ Refer to Exhibit E Site and Wreckage Group Factual Report

The floating wreckage which was recovered shortly after the crash was stored in a hangar in Sharm el-Sheikh airport. On 11 January 2004, the Site and Recovery Group met in the hangar for wreckage inspection. The wreckage was then identified (as much as possible), inspected, segregated (aircraft parts or personal effects). Later, the personal effects were transferred to the Egyptian Legal Authority in Sharm el-Sheikh. A database for the floating wreckage was created (including wreckage pictures).

Underwater Wreckage

Because of the depth of the Red Sea in the area where the accident occurred (approximately 1000 meters), specialized recovery resources were required for the submerged wreckage. The French vessels “Ile de Batz” and “Janus II” were contracted to conduct the underwater wreckage survey and recovery. Both vessels were equipped with deep water recovery capabilities consisting of submersible Remotely Operated Vehicles (ROV). The necessary support equipment to accurately locate and map the airplane wreckage was provided by the French Navy. An oceanographic vessel, the “Beautemps-Beaupré” was sent to the accident site to undertake a bathymetry (depth mapping) of the seabed and a survey of tidal currents.

Figure 1.12.4-2 ROV

FDR / CVR Recovery

The initial focus of the underwater recovery operation was finding and retrieving the protected recorders, the Cockpit Voice Recorder (CVR) and Flight Data Recorder (FDR) and mapping the searched areas. Each recorder is equipped with an acoustic transmitter, called a “pinger” that transmits a detection signal that can be used to locate the box. Based on the initial determination of pinger locations, the ROV from Ile de- Batz, Scorpio, began a visual search using its cameras to find the recorders. To refine the location of the pingers, a network of sonobuoys (GIB, GPS Intelligent Buoys), (see Appendix 5 for detailed description of this operation), was employed in a cooperative effort between the French and Egyptian Navies. This method

produced a new pinger position accurate to within 10 meters and the ROV was moved to the new location. A visual search of a grid created around the new pinger location resulted in discovery of the FDR on 16 January 2004. The FDR was recovered by the ROV and taken onboard the Ile de Batz. Custody of the recorder was transferred to the Investigator in Charge, at the port of Sharm El Sheikh.

The pinger of the second recorder (CVR) was initially identified approximately 800 meters north of the first pinger. However, it was decided to continue the visual search using grids in the area where the first recorder was found. This search was successful and resulted in finding of the CVR on 17 January 2004 (approximately 24 hours after the FDR). It was also taken onboard the Ile de Batz and custody was transferred to the Investigator in Charge at the port of Sharm El Sheikh.

FDR underwater Location: N27 52.3605, E34 22.0165.

CVR underwater Location: N27 52.3467, E34 22.0207.

The recorders were both sent to Cairo for read out and analysis.

The focus of the recovery operation then changed to detailed mapping of the wreckage and recovery of selected airplane equipment. In addition, the recovery operation included recovery of any equipment deemed important to the investigation based on the review of the FDR and CVR in Cairo.

Wreckage Mapping

During the structured search for the recorders, the position (latitude and longitude) and description of surveyed wreckage was recorded. Following recovery of the FDR and CVR, additional grids were defined for ROV operations. These grids were used to systematically survey and document the entire wreckage area. The positions of large pieces, such as the three landing gears and the cores of the two engines were identified.

Data from both ships involved in mapping and recovery were consolidated into a single listing of all surveyed wreckage, which is included herein as Appendix 2.

The distribution of wreckage is included within a rectangle of approximately 275 by 440 meters defined by the following corner point coordinates:

North corner:	N 27°52,559	E 34°21,933
East corner:	N 27°52,410	E 34°22,126
South corner:	N 27°52,294	E 34°22,022
West corner:	N 27°52,450	E 34°21,817

Multiple surveys of the area confirmed the containment of the wreckage within these established boundaries.

Recovered Wreckage

The investigation team developed a strategy for wreckage recovery based on the review of the FDR and CVR undertaken in Cairo. Flight control actuation components and flight deck systems were considered as a priority.

A system was developed for recording the description, external dimensions and the location, in latitude and longitude coordinates, of all recovered wreckage pieces. A database of recovered floating wreckage is included herein as Appendix 3. Another database documenting all wreckage recovered by Ile de Batz and Janus II is included as Appendix 4. Both databases reference digital images of all floating and recovered wreckage.

Recovered wreckage was stored aboard the ships in sea water until taken ashore and loaded onto trucks. All of the recovered wreckage is stored in a hangar at Sharm El Sheikh Airport and is under the control of the investigative authorities.

1.12.3 Partial list of the Recovered Wreckage

- Parts of the horizontal stabilizer central section structure (called “Texas Star”), elements of the elevator structure and components of the elevator control system, including both elevator PCU's (Power Control Unit), both autopilot actuators, the feel and centering unit including the feel actuator.
- Horizontal stabilizer jackscrew and actuator gearbox.
- Vertical stabilizer structure with rudder control system components, including the main rudder PCU and standby rudder PCU, the feel and centering mechanism and with the trim actuator.
- Aileron PCU, spoiler mixer and TBD spoiler actuators.

1.12.4 Initial Observations

- The two engines were found approximately 24 meters apart
- The left and right main landing gear assemblies were found in between the two engines
- The recovered thrust reverser actuator was found retracted
- The recovered leading edge flap actuator was found retracted
- The recovered trailing edge flap jackscrew indicates that flaps were retracted
- The stabilizer jackscrew was measured at 7.5 inches between the flat of the ball nut and the flat of the end stop which corresponds to a stabilizer leading edge position between 2 and 3 degrees down or a trim unit setting between 5 and 6 pilot units.¹⁸

¹⁸ B737-300 Aircraft Maintenance Manual 27-41-00

1.12.5 Wreckage Data bases and Photos

The full data base and photos of the wreckage are on a CD, which is available at the Egyptian Civil Aviation Ministry (MCA). This CD contains:

- a. A folder with three Excel files for wreckage complete data base.
 - i. Floating Wreckage data base.
 - ii. Recovered Wreckage data base.
 - iii. Underwater Surveyed Wreckage data base.

- b. A folder for photos with four sub-folders
 - i. Floating Wreckage Photos: 104 photos.
 - ii. Recovered Wreckage Photos: 98 photos.
 - iii. Underwater Surveyed Wreckage Photos: 330 photos.
 - iv. Wreckage Recovery Process Photos: 25 photos

1.13. Medical and Pathological Information

Egyptian Air Force – Medical Board Report

From : Egyptian Air Force – Medical Board
To : Chairman of Civil Aviation Medical Board
Subject: Medical records of RET. AVM Kheider Abdullah Saad

1. Sequence of medical records

- a) Medically fit for all flying duties as from his first medical examination dated 30/05/1970.
- b) Amend to be medically fit for all flying duties to be reexamined every six months as of 14/07/1982.
- c) Amend to be medically fit for all flying duties (remove six months restriction) as of 22/04/1985.
- d) Medically fit for all flying duties until his last medical examination dated 08/01/1997.

2. Medical History¹⁹

- a) Admitted to hospital on 06/02/1988, diagnosed (cut wound on left hand) sick leave until 20/02/1988, return to normal duty.
- b) Admitted to hospital on 26/04/1999, released on the same day, diagnosed (effusion left knee).
- c) Examined on 03/11/1999, fit for all flying duties as per last medical exam.

During Service A.F. Pilots are subjected to the following:

- a) Tests for Spatial Disorientation as part of his routine periodic physical examination.
- b) Sessions of physiologic training which include:
 - Sudden Decompression.
 - Certificate.
 - Spatial Disorientation Training Chair.

No report was found of any medical factors related to Spatial Disorientation.

¹⁹ During the time from 1997 to 1999 the Captain held an administrative post (Chief of Staff of an Airforce base) with no flying duties.

1.14. Fire

N/A

1.15. Survival Aspects

Refer to 1.12 Wreckage and Impact Information

1.16 Tests and Research

The FDR records the movements of the pilot's controls (e.g. control column, control wheel position and rudder pedals), the movement of the control surfaces (e.g. elevator, aileron and rudder) as well as motion of the airplane (e.g. pitch and roll attitude and heading angle). The performance evaluation was conducted to determine if the control surfaces were responding normally to the pilot's controls and if the airplane was responding normally to movement of the control surfaces.

In order to accomplish this work, Boeing's 737-300 aerodynamic simulation model was used to recreate the accident flight. The simulation calculates the response of the airplane to movement of the flight control surfaces – for example, it can calculate the roll rate resulting from a 10 degree deflection of the ailerons. The simulation has been verified by comparison against actual flight test data and was used for the design and certification of the 737-300 airplane. In addition, the simulation is the basis for 737-300 crew training simulators used around the world. It should be noted that the 737-300 simulation model is essentially a computer program that represents a nominal airplane with nominal engines. Small differences between the simulation and individual airplane's behavior are common and expected due to differences in control surface rigging, engine wear, and other normal tolerances.

1.16.1 Performance Evaluation

FDR data are recorded at relatively low sample rates and are recorded from different sources, some of which have inherent biases. Because of these issues, a kinematic consistency (KINCON) process was used to supplement the FDR data and calculate additional parameters to be used in the performance analysis. Kinematic consistency analysis is a general practice for processing flight data (either flight test data or FDR data) to ensure consistency of position, speed, and acceleration data.

1.16.2 Baseline Simulation

A baseline simulation recreation of the accident flight was started just as the airplane turned onto the runway and the throttles were advanced, and the simulation was stopped at the end of the FDR data. Because the simulation can calculate the response of the airplane to control inputs, a set of control input time histories (column, wheel, and rudder movements) can be determined that results in the simulation following the same path as the accident airplane. It is important to note that this process does not use the control or surface position data recorded on the FDR, only the path information (e.g. accelerations, attitude and altitude).

Comparisons between the recorded FDR data and the simulation time history data are provided for longitudinal and lateral/directional data in Figures Figure 1.16.2-1 and Figure 1.16.2-2 respectively.

Figure 1.16.2-1 – FDR and Simulation Match Data – Longitudinal Axis

Specifically, the extreme bank attitude that occurs towards the end of the flight is consistent with recorded motion of the ailerons.

The simulation also revealed that the motion of the control surfaces is consistent with the recorded motion of the control inputs, with the exception of control wheel

1.16.3 Hypothetical Faults resulting in a rolling moment

Several hypothetical airplane system faults were examined to determine if any could have resulted in the right roll behavior recorded on the FDR. These faults included:

- Uncommanded deployment of the #1 slat
- Uncommanded spoiler deflection to full travel (hardover)
- A spoiler disconnected from its actuator (spoiler float)
- Flap asymmetry
- Thrust asymmetry
- Unrecorded rudder motion

The hypothetical faults listed above are similar in that they each create a rolling moment unrelated to the position of the ailerons that will cause the airplane to bank. That is to say, if one of these faults had occurred, the path of the airplane would have differed from that predicted by the recorded position of the ailerons.

1.16.4 Multi-Purpose Engineering Cab Simulator

Additional tests were conducted at Boeing's multi-purpose engineering cab simulator or M-Cab. The M-Cab is similar to a flight crew training simulator in that it consists of a realistic flight deck mounted on a movable base. The M-Cab includes a visual system providing out-the-window views to the flight crew. Because the M-Cab is used to simulate the flight deck of many different Boeing models, actual flight instruments are not used. Instead, a large LCD display is programmed to simulate the flight instrument displays. Examples of the M-Cab's flight instrument displays for the 737-300 are shown in section 1.6.2.

Major differences between the M-Cab and a typical flight crew training simulator are listed below.

- The M-Cab can simulate different model airplanes including 707, 727, 737, 747, 757, 767, and 777.
- The M-Cab can be reprogrammed to simulate a wide variety of hypothetical aircraft system faults.
- The M-Cab can be "backdriven" to reproduce recorded data, such as the simulation match to the accident flight discussed in section 1.16.2. In addition, the backdrive can be interrupted at any point with a transition to normal simulator operation at the current flight conditions. This capability (known as "breakout" allows pilots in the simulator to attempt to recover the airplane from various points in the accident profile.
- The operation of the M-Cab is recorded at a high sample rate

The M-Cab was used to recreate the accident flight as well as to study a number of hypothetical airplane system faults.

1.16.4.1 Tests conducted in the M-Cab

The M-Cab was used to examine some of the faults mentioned in section 1.16.3, as well as a number of other hypothetical faults affecting the lateral control system or the autopilot system. M-Cab tests included:

- Backdrive of FDR data
- Backdrive with breakout at 02:44:44
- Backdrive with breakout at 02:44:56
- Spoiler float
- Uncommanded aileron trim to full authority
- Uncommanded aileron trim to half authority
- Autopilot servo actuator hardover without force limiter engaged
- Autopilot servo actuator hardover with force limiter engaged
- Autopilot servo actuator hardover with pressure regulator and relief valve inoperative

The tests in the M-Cab were conducted with an out-the-window scene equivalent to that available to the accident pilots with the following exceptions:

- 1) The visibility conditions simulated (ceiling and visibility unlimited at night with no moon) were those reported at the airport at the time of the accident. Actual visibility conditions on the flight deck at the time of the accident are unknown.
- 2) The ground in the vicinity of Sharm el-Sheikh was depicted through the use of satellite photography taken during daylight hours. It did not represent the nighttime scene of street lights, building lights, etc. against an otherwise dark landscape.

1.17. Organizational and Management Information

1.17.1. Flash Airlines

1.17.1.1. Flash Airlines Air Operator Certificate (AOC)

Flash Airlines was approved as air operator (charter air carrier) under ECAR 121 by the ECAA, and operating under approval no 018.

Flash Airlines has its main office in Cairo, Egypt at 166b El Hegaz St. Heliopolis. Beginning in 2000, Flash Airlines leased the first B737-300 from the International Lease Financial Corporation (ILFC). In June 2001 another B737-300 from ILFC was added to Flash Airlines fleet, which made the company fleet two aircraft the same type. The Operations Specifications was issued to the company in Feb 2000 and the last revision was on October 29th 2003.

1.17.1.2. History

Flash Airlines is also approved under ECAR 145 as a repair station. The approval number is CAI/FLASH?AS/1/2001. The certificate is valid until July 30th, 2004 and was issued on July 31, 2001. The certificate is limited to line maintenance up to the 8A check for the B737-300. Flash Airlines maintenance base is Cairo international Airport.

Flash Airline Organization Chart:

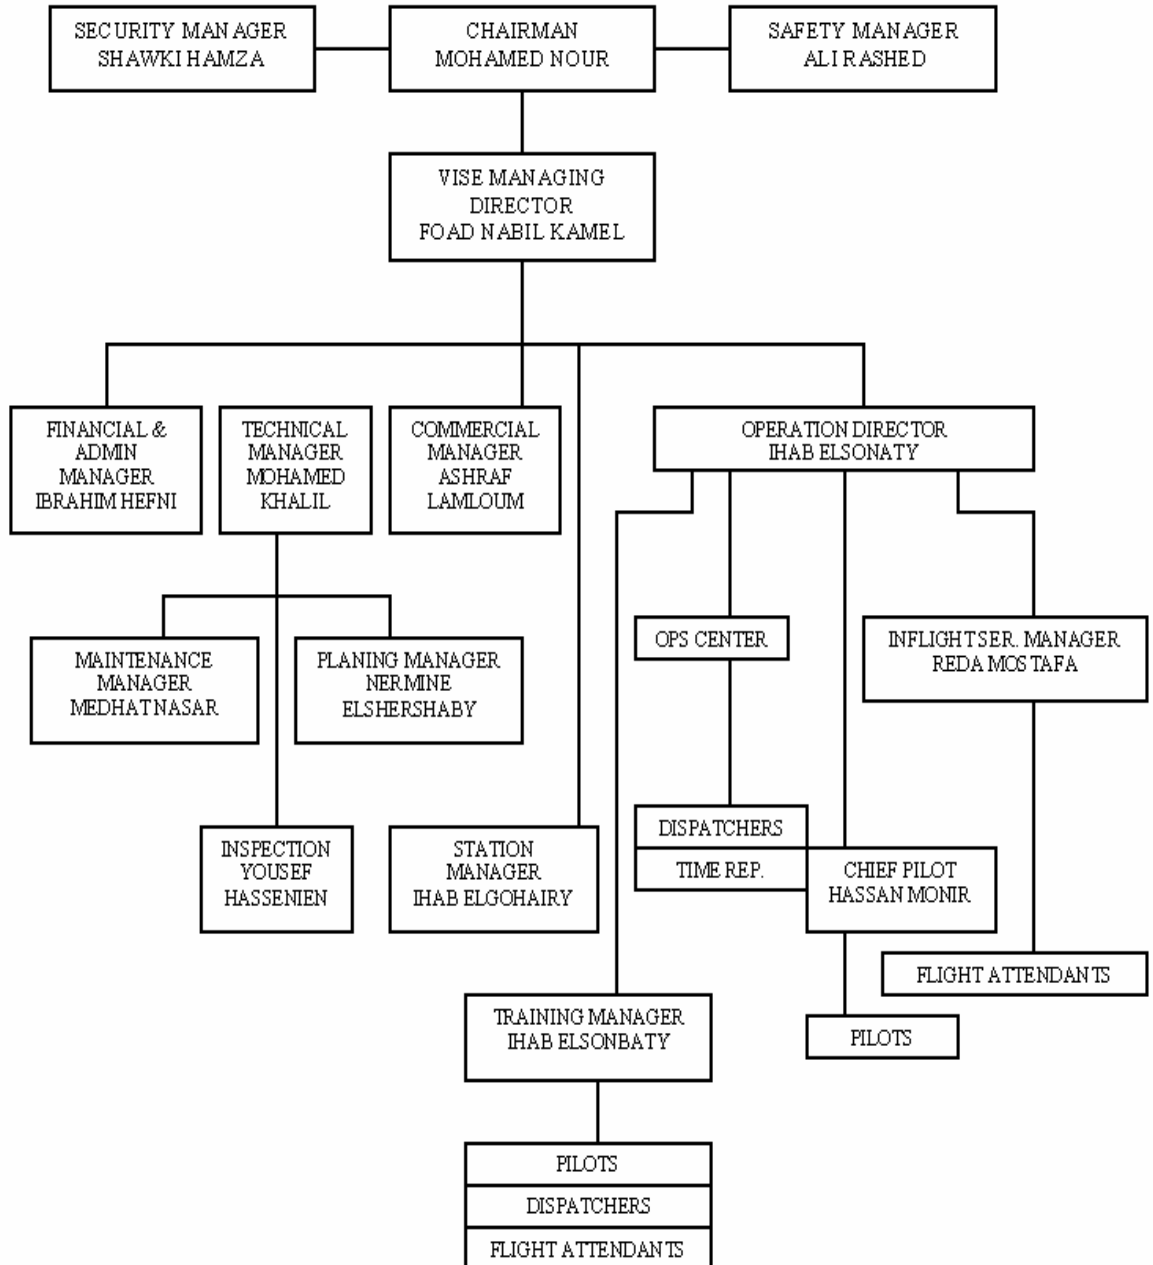

Figure 1.17.1-1 Flash Airlines Organization Chart

Flash Airlines coordinates the maintenance program through its ECAR Part 145 certificate. The Company General Maintenance Manual (GMM) provides guidance related to the Aircraft Maintenance program as the Maintenance Procedures, Maintenance staff Training... etc.

Personnel working on Flash Airlines Fleet at the various maintenance facilities must be familiar with the policies and procedures spelled out in the company GMM. The Quality Control Manager puts the newly hired employees through a twelve-hour Indoctrination Course. The Indoctrination course includes Flash Airlines policy/ procedures, and training practices. It is accomplished before maintenance engineer begins to work at the Flash Airlines facility. The training is documented on a maintenance training attendance record, recorded on the employee's training file.

1.17.1.3. Personnels Training and Authorization
1.17.1.3.1. Maintenance Engineers

According to ECAR 65 the requirements for granting authorization for ground engineer are as follow:

- 1- Graduation from Faculty of Engineering or an approved training institute.
- 2- Passing the approved Basic training Course at approved Training Center or institute.
- 3- On Job Training for 18 months.
- 4- Passing written, practical and oral exams by the authority for License without Type Rating (LWTR).
- 5- Passing an approved training course for a specific type airframe and engine.
- 6- On Job Training (OJT) on the type airframe and engine for 9 months.
- 7- Attendance of training course for the company exposition procedure manual.
- 8- Passing oral and practical examination in front of the Company Examination Board (approved by the authority)
- 9- Getting the company approval.

Flash Airlines maintains its training program in compliance with Egyptian Civil Aviation Regulation requirements. The Maintenance Director and the Quality Control Manager have joint responsibility for assuring all required training is performed and recorded.

Indoctrination training proceeds an employee's start date. The employee is given a 4-hour introduction course that trains one on Flash Airlines maintenance policies and procedures. The training will be documented on a maintenance training attendance record and maintained in the employee's training file.

The aircraft systems training for the A & C Engineers is accomplished through formal systems training and On-the-Job Training (OJT) Worksheets.

Engineer Mustafa Erfan carried out the last pre- flight release.

1.17.1.3.2. Cockpit Crews

Refer to Exhibit F Operation Group Factual Report, Attachment 1

1.17.2. Review of oversight by ECAA on 2003

1.17.2.1 Safety oversight carried out on Flash Airline during the period from 2 Jan, 2003 to 16 Jan 2003 before AOC renewal

The oversight findings and the relevant actions taken by the airline are shown in the table below

A- Operation Findings

	Findings	Actions Taken
1	There is no Training Program	Training Program is submitted and approved
2	There is no Internal Evaluation Program (IEP)	IEP is submitted and approved
3	There is no Line check Training for Captains	Line Check Training is performed
4	No ECAR Training Course was performed recently	Training course has started and it will take some time to cover all the operation personnel
5	There is no approved Training Class	Training Class is Approved.
6	There are no DRM & CRM Training course performed for cockpit crews ,dispatchers and cabin crews	The Airline has introduced a training plan starting on Sep 2003 to be done in PAS Airline
7	No of cockpit crews are not fulfilling the minimum requirement of ECAA	The cockpit crews are sufficient for required operation and the airline will recruit more cockpit crews to fulfill the future operation requirements
8	By reviewing the A/C log book sheets found that ,some sheets not filled out and other some have missed data	The airline issued circular for all cockpit crews and maintenance staff to strictly comply with log book sheets filling out instructions
9	By reviewing the airline TM,GOM and Dispatch Manual some findings were discovered	All findings are covered
10	The submitted station manual not fulfilling ECAA requirements	The Station Manual was updated to fulfill the ECAA requirements
11	The Safety Manual which was submitted by the airline does not meet ECAA requirements	New manual revision is in progress
12	Cabin Crew does not use safety and	A circular was issued for the cabin crew

	emergency check lists	to strictly comply with the written instruction for using the check lists
13	There is no security program for Aircraft	The program is submitted and approved
14	Load sheet calculations for some flights not accurate	Load sheet calculations training course is planned to be done for all flight dispatchers

B-Airworthiness Findings

	Findings	Actions Taken
1	There is shortage of some maintenance equipment and tools	The unavailable equipment and tools will be loaned from EgyptAir when required
2	Personnel files are not updated	Files are updated
3	GMM is not Updated	GMM is updated
4	There is no AMM in the library	AMM is Available now in the library
5	MPD, AFM, CMEL, and FOM are not Updated	All manuals are updated
6	There is no Training Program for Recurrent Course	The recurrent training program was submitted and approved
7	Authorization Board does not include electric engineer	The electric engineer authorization will be issued by ECAA
8	The airline has not submitted SOC 121	SOC 121 was submitted and Accepted
9	Some parts are not calibrated	The parts required to be calibrated were sent to EgyptAir for calibration
10	Safety wire of fire bottles do not meet the standards	Safety wire corrected to meet the standards
11	Spare parts in the store are not sufficient	The required spare parts will be loaned from EgyptAir when required
12	A/C tires storage is not according to the storage requirement	Storage requirement familiarization course is performed for the storage keepers
13	The storage keepers are not familiar With GMM	GMM training course is planned to be performed
14	There is no safety requirement program	The program is submitted and approved
15	By reviewing the TLB Sheets ,found that , some sheets not including PDC Maintenance Release and ECM data	An inspection Circular is issued for the maintenance personnel sign PDC Release after PDC performing

1.17.2.2 Safety oversight carried out on Flash Airline on 16 Jul 2003 before AMO Certificate renewal

The oversight findings and the relevant actions taken by the airline are shown in the table below

	Findings	Action Taken
1	There is no W&B Program	The program is submitted and approved
2	Human factors training program for the engineers not yet submitted to ECAA for approval	Human factors training program for engineers is submitted to ECAA and approved

1.18. Additional Information

**Flash Airlines Flight 604 Investigation
Crew Behavior Subcommittee**

Minutes of a Meeting Held at the Offices of the Ministry of Civil Aviation

**Cairo, Egypt
August 23-26, 2004**

Materials Provided by MCA

1. Paragraph interview summaries
2. One page summary of medical records provided to MCA by Egyptian Air Force after the retirement of the accident captain
3. Ops group chairman's factual report
4. Capt's flight time summary & schedule for previous 30 days
5. FO's flight time summary & schedule for previous 30 days
6. Capt's MCA pilot certification file
7. Capt's CV (1-page summary of qualifications and type certificates)
8. Captain's meteorology training course certificate from Egyptian Air Force (taken by Capt in 1984 and provided to MCA when he became civil pilot)
9. Capt's Proficiency Check Form from May 12, 2003 and transition training form from May 13, 2003
10. Capt's recurrent training form from Dec 16, 2003
11. Capt's Line Check form from July 23, 2003
12. Capt's Oral Exam form from May 12, 2003
13. Capt's ICE training form from May 28, 2003
14. Capt's Fixed Base Sim training record from April 28, 2003
15. Capt's Full Flight Sim training record from May 3-12, 2003
16. Capt's flight time records from the Air Force, Dec 14, 1999
17. FO's MCA pilot certification file
18. FO's transition training record from June, 2002
19. Flash Air Ground syllabus for 737 -300 course
20. FO's Proficiency Check Form from June 30, 2002
21. page #2 of previous
22. FO's Proficiency Check Form from July 11, 2002 (difficult to read)
23. FO's ICE training form from Aug 12, 2002
24. page #2 and #3 of previous
25. FO's Competency Check (ground school on emergency operations- training conducted at Egypt Air) from May 22, 2002
26. FO's Proficiency Check form from May 15-16, 2003
27. FO's Recurrent Training form from Dec 11, 2003
28. FO's Flash Air special course on emergency procedures, HAZMA T, first aid (practical test tied to handling dangerous goods)
29. FO's MCA test performance and systems certification oral exam
30. FO's basic indoctrination course form (from MCA at Egypt Air facility)
31. FO's ICE form
- 32-39 -FO's full flight simulator training form from June 22-July 7, 2002
40. MCA CVR-FDR overlay plots (3 pages)

Materials made available for review during the meeting:

- MCA medical certification records of the captain
- Flash Air general operations manual
- Flash Air training manual

Definition of spatial disorientation

Spatial disorientation is an incorrect perception of attitude, altitude or motion of one's own aircraft relative to the position of the Earth.

Type I spatial disorientation:

Unrecognized spatial disorientation. No conscious perception of SD. Distractions are often antecedents to the accident. Crash with no distress or concern expressed. No mayday or other than routine communications. Unusual or inappropriate aircraft attitude, but pilot does not make any appropriate corrective action. Pilot is apparently oblivious to the situation.

Type II recognized:

Conscious manifestation of a problem. Pilots often incorrectly refer to this experience as vertigo. Pilot recognizes conflict between perceived and intended or expected attitude. Can assume that the instruments are operating incorrectly. Might not properly react because of difficulty accepting indicated correct control input or might just be puzzled about the situation. Confusion might persist after recovery and lead to compounding of SD problem.

{Veronneau, S.J.H. & Evans, R.. (2004). Spatial disorientation mishap classification, data and investigation. Previc, F.H. & Ercoline, W.R. (Eds) Spatial disorientation in aviation. American institute of Aeronautics and Astronautics.}

Conditions for establishing spatial disorientation

1. Presence of inaccurate or misleading vestibular cues.
2. Absence of visual cues or presence of misleading visual cues.
3. Presence of a distraction capable of drawing attention away from attitude displays.

Closing Comments

This is a preliminary report. More work is needed to comprehensively address all human factors issues relevant to this accident, as needed.

Complete minutes of CBS meeting will be made available to the sub committee for further work and analysis

Interviews regarding Captain Kheider Abdullah

[REDACTED]

Worked together in the Egyptian Air Force and later in Civil Aviation.

A religious man, accurate in his work, does not recall medical complaints or use of any significant medication, was aware of maintaining his health, had self respect in all dealing with others.

- **[REDACTED] wife of Captain Kheider**

Spoke very highly of him; he never created any problem for her all through their married life – chose to cure any minor health problem by using natural components such as herbs – played soccer until five years ago – never complained of headaches, dizziness or unbalance, did not mention any work related problems to her or his children.

- **Meeting with Captain Khedr's wife 24/10/2004**

All his life Captain Khedr motivation for flight was very high he used to care of his health and eat organic foods and much salad. When he is expecting a journey he used to close his room to have a good sleep while taking off the telephone. He was married since 30 years; he has 3 children and one grand child. Two children are living with him.

No accidents either aeroplane or crush car was reported. He was much praised at work. In the year 1999 he was awarded a prize when he landed in a difficult weather in Sarajevo.

- **First Officer [REDACTED]**

Important note: [REDACTED] flew with Captain Kheider 48 hours prior to the crash.

Had good relations with everybody regardless of position or rank. The last flight was the F/O birthday and the Captain celebrated the event on the A/C by sharing a cake with all the crew, this gesture left a very positive impression on everybody.

- **First Officer [REDACTED]**

Says Captain Kheider was calm and balanced person and in spite of his long experience he always took time to read and prepare well before any flight, he was well disciplined and did not smoke.

- **First Officer [REDACTED]**

Flew frequently with Captain Kheider, learnt a lot from him and his long experience, was of good character, calm during flights and he did not observe anything about his behavior that was not normal.

- **First Officer [REDACTED]**

Flew frequently with Captain Kheider, she says that he was intelligent, observant and highly concentrated on his work during flights, balanced, calm and disciplined.

- **Meeting with traffic officer Mr. [REDACTED]**

(Sharm El Sheikh Station Manager)

[REDACTED] met the 3 crew members and he know them well during the months proceeding the accident. Crew members:

- 1) Captain Khedr.
- 2) F/O Amr El Shafy.
- 3) Engineer Mostafa Askar.

He used to see them in the office during work and a lot during rest periods in Sharm El Sheikh City. Either staying in a hotel or taking supper together in a restaurant in the City.

He noticed they were pleasant and within normal behavior. No special incidents or accidents or quarries occurred during that period.

Captain Khedr was specially accurate and meticulous in his work and famous for his punctuality. He likes his work very much and talks about it with pride and satisfaction. He used to smile and talk nicely to all crew members specially before flights. Between journeys he used to stay at hotel taking complete rest. I used to see Captain Khedr daily in between trips.

On the 3rd day before accident nothing specially was observed with normal relationship with a crew.

- **On the day of the accident**

Due to pressures of reservation in hotels, Captain Khedr and F/O were in Fantasia hotel and the rest of the crew was in Coral Beach Hotel. The bus brought the crew first then the Captain and first officer from the 2nd hotel with a difference of 15 min. the aeroplane arrived and I gave them the documents and Captain Khedr requested the usual questions (like the No of passengers).

Captain Khedr was joking with me and told me I can take you with me now to Cairo (on aeroplane) this happened while the first officer is busy checking, the different systems of aeroplane and entering the computerized route plan he is usual a calm person with little but pleasant talking.

Cairo, January 26,2004

AIRCRAFT MAINTENANCE RECORDS GROUP
FACTUAL REPORT

A. ACCIDENT

Location: Sharm El Sheikh Airport, South Sinai
Date: January 3, 2004
Time: 0246 UTC, 0446 Local Time
Aircraft: Flash Airlines, Flight FSH 604,B737-3Q8, SU-ZCF.

B. AIRCRAFT MAINTENANCE RECORDS GROUP

C. SUMMARY

On January 3, 2004, about 0246 UTC, Flash Airlines flight FSH604, a B737-3Q8, SU-ZCF plunged into the Red Sea shortly after takeoff from Sharm El Sheikh International Airport (SSH) in South Sinai, Egypt. The flight was a passenger charter flight to Charles de Gaulle Airport (CDG), France with a stopover in Cairo international Airport (CAI) for refueling. Two cockpit crewmembers (Pilot and Co-pilot), three cabin attendants and 143 passengers (135 French and 8 Egyptian) onboard were killed. The airplane was destroyed due to impact forces with the red sea.

On January 11, 2004, the Aircraft Maintenance and Records Group convened at Flash Airlines Headquarter in 166b El Hegaz St, Heliopolis, Cairo Egypt in order to meet and interview Flash Airlines Technical Director and his staff. They collected all documents and records available for the subject aircraft. The rest of the aircraft records were delivered to the Accident Investigation Team on January 14, 2004. The Aircraft Maintenance and Records Group examined Flash Airlines maintenance program and the airplane records of SU-ZCF. The Aircraft Maintenance and Records Group completed the field review and examination on January 26, 2004.

The Aircraft Maintenance and Records Group performed a review of airworthiness directives, maintenance program , weight and balance report, supplemental type certificates, maintenance discrepancies, and contracts. Results of these reviews are summarized in this report.

All Interviews are attached to Appendix A of this report.

D. DETAILS OF THE INVESTIGATION

1.0 Flash Airlines Air Operator Certificate (AOC)

Flash Airlines is approved as air operator (charter air carrier) under ECAR 121 by the ECAA, and operating under approval no 018.

Flash Airlines has its main office in Cairo, Egypt at 166b El Hegaz St. Heliopolis . Beginning in 2000, Flash Airlines leased the first B737-300 from the International Lease Financial Cooperation ILFC. In June 2001 another B737-300 from ILFC was added to Flash Airlines fleet which made the company fleet two aircraft the same type. The Operations Specifications was issued to the company in Feb 2000 and last revision was on October 29th 2003.

2.0 Aircraft History

Per Egyptian Civil Aviation Safety and Security Authority (ECASSA), civil aviation aircraft registration records , the International Lease Financial Cooperation (ILFC) leased the accident aircraft, serial number 26283, to Flash Airlines on May 14, 2001. It was registered in Egypt on June 17, 2001 under tail number SU-ZCF to be operated by Flash Airlines. The subject aircraft basic information as following:

Aircraft Type	: B737-3Q8
Minimum Crew	: 2 (Pilot and Copilot)
Registration Mark	: SU-ZCF
Serial Number	: 26283
Manufacture Date	: October 1992
Line Number	: 2383
Variable No	: PQ294

Interior Configuration : Total 148 Economy Class

ECAA Minimum Number of Flight Attendant : 3

3.0 Aircraft Maintenance

3.1 Maintenance Program Summary- Flash Airlines B737-300

Flash Airlines has developed their customized Maintenance Program . The Maintenance Program last revision was issued on January 20, 2003 and approved by the Egyptian Civil Aviation Safety and Security Authority (ECASSA), Airworthiness Central Administration under approval No MOCA/FLASH/737-300/MP/R2/03. This Maintenance Program was incorporated guidance from Boeing Maintenance Planning Document (MPD) Revision July 2002.

The Periodic Service Check is accomplished on layover. The check is performed as a walk-around, visual inspection and servicing when necessary.

The Routine Inspection is performed every 250 flight-hours (A Checks). A Routine Inspection Procedures Index is used to assure the check is completed. The Inspection consists of a visual inspection of the aircraft's major components, servicing, operational and functional checks.

The Maintenance Program contains subparts related to:

- 1- Line Maintenance Checks: Transient, Daily and Weekly Checks.
- 2- "A" Checks which should be carried out at 250 Flight Hours Interval and its multiples. The following chart will show how are the "A" checks cycled:

"A" Check Cycle (250 Flight Hours Intervals per Cycle – 16 "C" Check)																
Check	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
A	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
2A		x		x		x		x		x		x		x		x
4A				x				x				x				x
8A								x								x

- 3- "C" Check which should be carried out every 4000 flight hours and its multiples. The following chart will show how are the "C" checks cycled.

"C" Check Cycle (4000 Flight Hours Intervals per Cycle)								
Checks	1	2	3	4	5	6	7	8
1C	x	x	x	x	x	x	x	x
2C		x		x		x		x
4C				x				x
6C						x		
8C								x

- 4- Components: This section contains general information on selected airframe and engine components. They are Condition Monitoring, On Condition or Hard Time.
- 5- Structure Inspection which should be carried out every 24000 Flight Hours. Structural inspections are performed in accordance with guidelines set down by the manufacturer Boeing MPD.
- 6- Corrosion Prevention Control Program (CPCP)
- 7- Pylon Inspections (ATA 54) the 15 Months and 45 Months Checks

The checks and inspection times can not be exceeded except by using the short term escalation as authorized per the Operations Specifications D95 issued by ECASSA to Flash Airlines and considered as a part of the air operator certificate AOC No 18.

The last "A" check accomplished by Flash Airlines and the last "C" check and Structural inspection carried by Braathens Engineering and Maintenance for the SU-ZCF were as follows:

- "8A" Check : December 12, 2003 at 25423:50 Flight Hours
- "7C" Check : From Nov 3 - Dec 21, 2002 at 23531 Flight Hours
- Last SI Check : From Nov 3 - Dec 21, 2002 at 23531 Flight Hours
- Last 15 M Chk : From Nov 3 - Dec 21, 2002
- Last 45 M Chk : From Nov 3 - Dec 21, 2002

Copy of the checks done on the aircraft is attached (attachment 01)

3.2 Maintenance Time Limitations

Scheduled maintenance checks are approved by ECASSA (Flash Airlines Operations Specifications D88), and are in accordance with the Boeing 737-300 Maintenance Planning Documents MPD¹.

¹ The Boeing 737-300 Maintenance Planning Data (MPD) document provides maintenance planning information necessary for each 737 operator to develop a customized scheduled maintenance program

Transient Check:	Before each flight
Daily Check:	Every 24 hours that the airplane is in service.
7 days check:	Every 7 Calendar days.
Check “A” Systems and multiples:	Every 250 Flying hours and multiples.
Check “C” Systems and multiples:	Every 4000 Flying hours.
Structural Inspections:	Every 24000 Flying hours

3.3 Aircraft Summary

Total Hours at Time of Accident:	25603 Flight Hours
Total Cycles at Time of Accident:	17976 Flight Cycles

3.4 Weights and Balance Summary

According to the Egyptian Civil Aviation Regulations, ECAR 91 Appendix H attachment 1 the aircraft has to be reweighed every three years . Furthermore, aircraft must be reweighed if the effect of modifications on the mass and balance is not accurately known. Flash Airlines aircraft was weighed last time on December 19, 2002 in Braathens SAFE, Stavangar, Norway. and recalculated by Flash Airlines after the reenforced cockpit door modification installation on November 1st, 2003, and the results were as follows.

Empty Weight	:	70794 lbs
Moment	:	45921358.6 lb.in
% AMC	:	17.42%

3.5 Engines: CFM56-3C-1

Engines are maintained in accordance with Flash Airlines Maintenance program and are based on the life cycle limits of the rotating components. CFMI Engine maintenance manual together with the applicable Service Bulletins and engine teardown data determine these limits. Overhauls are performed at the SNECMA MOROCCO Workshop or other authorized Certified Repair Station.

	<u>Engine Position 1</u> (Left Side)	<u>Engine Position 2</u> (Right Side)
Serial Number (ESN)	857352	856481
Time Since New (TSN)	25314 hours	26045 hours

Cycles Since New (CSN)	17815 Cycles	17523 Cycles
Date of Installation on SU-ZCF	August 1998	Jan 3, 2003
Time Since Last O/H	8741 Hours	1828 Hours
Cycles Since Last O/H	6188 Cycles	909 Cycles

Engine Disks and First Limiters Status as per attached (attachment 02)

3.6 Engine Monitoring System

Flash Airlines engines are monitored as per the manufacturer (CFMI) engine condition monitoring program (Sage Trend Analysis program). Sage is a set of programs which collectively provide the functionality to perform standard condition monitoring of CFMI engines. Sage is designed to work in an interactive environment with the major analytical calculations performed at scheduled times throughout the day.

By reviewing the engine condition monitoring trend reports for both engines, they showed no deviation or important shift, the EGT margin is considerable ok. Engine Condition Monitoring cruise trend sheet is attached (attachment 14)

3.7 Flight Data Recorder/ Cockpit Voice Recorder.

Description	P/N	S/N	Test Date	Workshop
Sundstrand FDR CVR	980-4120-DXUN 93A100-80	10069 57994	O/H 18/11/02 Tested 12/11/02	Air Transport Avionic Braathens

3.8 Aircraft Status

3.8.1 Minimum Equipment List (MEL)

Flash Airlines Customized Minimum Equipment List CMEL was approved by the ECASSA on Feb 23rd, 2002 under approval number ECASSA/FLASH/MEL/737-300/02/02 according to MMEL² R40, meanwhile another revision according to the last Master Minimum Equipment List (MMEL) revision 45 is currently under approval by the ECAA.

² The Master Minimum Equipment List (MMEL) is a FAA approved document, with participation by the aviation industry, intended to assist airline operations and maintenance organizations in developing the procedures required to operate the aircraft in various nonstandard configurations. It is also intended to permit operation with inoperative items of equipment for a period until repair can be accomplished. In order to maintain an acceptable level of safety and reliability, the MMEL establishes limitations on the duration of and conditions for operation with inoperative equipment. It is the basis for development of individual operator MEL that take into consideration the operator's equipment configuration and operational conditions.

3.8.2 Aircraft Condition Report (A/C deferred defects)

No deferred items were recorded in the aircraft deferred snags log Book

3.8.3 Type Certificate Data Sheet

FAA "Type Certificate Data Sheet" number A16WE (revision 28, dated October 29, 1999) for B737-300 series airplanes was reviewed for compliance conditions and limitations. No discrepancies were noted. Type certificate Data Sheet attached (attachment 15)

3.8.4 Supplemental Type Certificates

Supplemental Type Certificates supplied by Flash Airlines were reviewed. One Supplemental Type Certificate was issued to install a Matsushita Audio Entertainment System in accordance with General Aerospace Engineering Order No GA-23-1042. STC attached (attachment 16)

3.8.5 Airworthiness Directives (AD) Summary and Service Bulletins (SB) Summary

The Airworthiness Directives compliance status list dated January 12th, 2004 (attachment 03) submitted by Flash Airlines was reviewed with special concentration on AD's carried out after the aircraft was leased by Flash Airlines.

The previous AD's Status which was forward to Flash Airlines during the aircraft delivery was reviewed with special attention to those AD's which had an open or repetitive status.

All listed Airworthiness Directives and Service Bulletins have been complied with no discrepancies noted.

Service Bulletins compliance status attached (attachment 17).

3.8.6 Time Controlled Components

Time Controlled items listed on the Boeing 737-300 Maintenance Program, including task card number, part/serial numbers, and the time interval, were reviewed. The listing by task card noted categories (inspections, functional check, restoration, or scrap). Flash Airlines has no exceedance for the MPD recommendations. No discrepancies were noted. Components list replaced by Flash Airlines attached (attachment 04)

3.8.7 Prior Discrepancies/Accidents Involving SU-ZCF

Per Flash Airlines records, no previous accidents were reported for the accident aircraft.

3.8.8 Logbook Forms

The original aircraft Technical Log Book sheets were reviewed for the last three months from September 27, 2003 through December 2003 for discrepancies, no trends or discrepancies noted. The list of the reviewed Technical Log Book sheets is attached:

Few number of pilot reports are recorded. Some corrective actions recorded by the maintenance staff without pilot reports. Copy of the Tech Log Book entry listing is attached (attachment 05)

Copies of the Technical Log Book sheets following the original copies (from Dec 27, to Dec 31, 2003) were reviewed also. The following are the review results:

- The Line Maintenance checks (transient, PDC and Daily) are properly carried out and recorded by the certified staff.
- All Pilots acceptance are recorded.
- Pilots reports are very limited, however many corrective actions are recorded by the maintenance staff.
- Some Technical Log Book sheets are missed From serial no 1998 up to the accident flight. (Shown as per attached schedule)

4.0 Maintenance Participants

Prior to the accident, the most recent scheduled maintenance performed on the accident aircraft was (8A check) done by Flash Airlines, Cairo base on December 11, 2003. Also, the PDC check was carried out by Flash Airlines Engineer at SSH station just before the accident. Due to the unavailability of the missed technical log book sheets, an interview, and document review were conducted to obtain information about the maintenance performed at this station before the accident flight.

The on board ground engineer said that there weren't any abnormal problem with the aircraft during the flight to SSH from VCE. And nothing was reported from the pilot. Interview attached (attachment 06)

4.1 Flash Airlines Approved Maintenance Organization (AMO)

Flash Airlines is also approved under ECAR 145 as a repair station . The approval number is CAI/FLASH?AS/1/2001. The certificate is valid until July 30th, 2004 and was issued on July 31, 2001. The certificate is limited to line maintenance up to the 8A check for the B737-300. Flash Airlines maintenance base is Cairo international Airport.

Flash Airlines coordinates the maintenance program through its ECAR Part 145 certificate. The Company General Maintenance Manual (GMM) provide guidance related to the Aircraft Maintenance program as the Maintenance Procedures, Maintenance staff Training... etc.

Personnel working on Flash Airlines Fleet at the various maintenance facilities must be familiar with the policies and procedures spelled out in the company GMM. The Quality Control Manager puts the newly hired employees through a twelve-hour Indoctrination Course. The Indoctrination course Flash Airlines policy and procedures, and training practices. It is accomplished before maintenance engineer begins to work at the Flash Airlines facility. The training is documented on a maintenance training attendance record, recorded on the employee's training file.

4.2 Contracted Repair Station Listing

- EgyptAir Maintenance and Engineering
- Braathens Maintenance and Engineering
- Snecma Morocco Engine Services.

5.0 Personnel Training and Authorization

According to ECAR 65 the requirements for granting authorization for ground engineer are as follow:

- 1- Graduation from Faculty of Engineering or an approved training institute.
- 2- Passing the approved Basic training Course at approved Training Center or institute.
- 3- On Job Training for 18 months.
- 4- Passing written, practical and oral exams by the authority for License without Type Rating (LWTR).
- 5- Passing an approved training course for a specific type airframe and engine.
- 6- On Job Training (OJT) on the type airframe and engine for 9 months.
- 7- Attendance of training course for the company exposition procedure manual.
- 8- Passing oral and practical examination in front of the Company Examination Board (approved by the authority)
- 9- Getting the company approval.

Flash Airlines maintains its training program in compliance with Egyptian Civil Aviation Regulation requirements. The Maintenance Director and the Quality Control Manager have joint responsibility for assuring all required training is performed and recorded. Indoctrination training proceeds an employee's start date. The employee is given a 4-hour introduction course that trains one on Flash Airlines maintenance policies and procedures. The training will be documented on a maintenance training attendance record and maintained in the employee's training file.

The aircraft systems training for the A & C Engineers is accomplished through formal systems training and On-the-Job Training (OJT) Worksheets.

Engineer Mostafa Erfan Askr does the last flight release.

Engineer Mostafa was graduated from the National Civil Aviation Training Organization on September 6th 1972. He worked as a mechanic for the Kuwait Airways for twenty years during which he received the following training courses:

- 1- B 747-269B Mechanics Familiarization during the period between Feb 17th 1979 to March 3rd 1979. (Kuwait Airways).
- 2- Airbus Mechanics Familiarization Course during the period between October 6th to October 18th 1984 (Kuwait Airways).
- 3- B767 Mechanics Familiarization A&C Course during the period between February 7th to February 19th, 1987 (Kuwait Airways).

In 1991 he took the Cessna 188 course at DEVCO training center, then he got his Egyptian license without type rating (LWTR) No 1525 on August 1st 1992 which is valid until July 27th, 2004.

He joined Flash Airlines two years ago, during this two years he had the following training and exams:

- 1- B737-300 type course at EgyptAir approved training center during the period between December 22nd, 2002 to February 27th, 2003.
- 2- Basic Indoctrination Course during the period between 13-14 June 2003.
- 3- An on Job Training for 9 months on Flash Airlines B737-300 fleet.
- 4- An approval authorization exam for the engine on November 2nd, 2003 and for the airframe November 3rd, 2003.

His approval No: 014 Valid until: July 26th, 2004 Issued on: Nov 28th, 2003
LWTR No: 1525 Valid until: July 27th, 2004 issued on: August 1st, 1992

6.0 Contracts

6.1 Flash Airlines and EgyptAir Approved Maintenance Organization Contract

The contract between Flash Airlines and EgyptAir Maintenance and Engineering Approved Maintenance Organization (attachment 07) was signed January , 2000. There are 15 agreement statements throughout the contract identifying conditions in which the two companies will work together.

Per the contract, EgyptAir will perform maintenance routine checks (A check and its multiples and C Checks and its multiples) and any requested AD's accomplishment on the B737-300 operated by Flash Airlines.

Flash Airlines provides the work package for the required routine check including the routine task cards, engineering orders weather for Airworthiness Directives, Service Bulletins, or modifications as well as other non-routine task cards that may be required to be accomplished concurrently with the routine check, in addition to any rectified defects by EgyptAir during the check.

EgyptAir is an approved maintenance organization as per ECAR 145 under approval No CAI/EGYPTAIR/AS/01/98 issued by ECASSA

6.2 Flash Airlines and Braathens Maintenance and Engineering Contract.

The contract between Flash airlines and Braathens Maintenance and Engineering in Stavanger, Norway (attachment 08). It became effective on November 3rd, 2002. There are thirty statements of understanding and two Appendices that explain the conditions of the Agreement.

Flash Airlines provides the required work scope as per their approved maintenance program. Braathens Maintenance and Engineering supplies the necessary consumables, routable parts, and equipment.

Braathens Maintenance and Engineering is approved as Per ECAR 145 approved maintenance organization under approval CAI/BRAATHENS/AS/1/2002.

6.3 Flash Airlines and SNECMA MOROCCO ENGINE SERVICES.

The contract between Flash Airlines and SNECMA MOROCCO ENGINE SERVICES (attachment 09) was signed on November 7th, 2002. There are 22 agreement statements throughout the contract identifying conditions in which the two companies will work together.

Per the contract, Flash Airlines and Snecma MOROCCO ENGINE SERVICES have entered into this agreement to stipulate and regulate terms and conditions for repair/overhaul of Flash Airlines CFM56-3C-1 Engines rated 22 klbs. According to the agreed workscope, it includes repair, engine performance restoration, and application of any applicable AD's.

SNECMA MOROCCO ENGINE SERVICES is approved as Per ECAR 145 approved maintenance organization under approval CAI/SNECMA MOROCCO/AS/1/2002

7.0 Maintenance Performed on the A/C before the accident flight.

7.1 Maintenance done by Flash Airlines Tech Staff at Cairo Base

The Last Check carried out on the accident aircraft was an 8A check. The check was performed by Flash Airlines Technical staff at Cairo base station. The check workpackage included visual inspection, servicing, and operational checks. A routine borescope inspection for the HPT nozzles guide vanes and the combustion chamber was performed on both engines by EgyptAir with no findings. The workpackage was reviewed with no discrepancies.

7.2 Transient Check carried out for the Flight VCE/SSH

A transient check was carried out in VCE by engineer Motaz Awad on January 2nd, 2004 a copy of the interview with him is attached (attachment 06)

7.3 Last PDC Carried out for the Accident Flight

On January 3rd, 2003, aircraft SU-ZCF, a daily check was performed in accordance with the approved checklist as per the company maintenance schedule at SSH station just before the flight. The check was carried out by the accident flight, on board engineer (Eng Mostafa Askar).

7.4 Aircraft Refueling before the Accident Flight and investigations done after the accident.

The Refueling was done for the accident aircraft on January 3rd, 2004 between 03:50 and 04:00 local time (UTC +2) for the quantity of 3500Liters by truck no 4432 belonging to Misr Petroleum Company (service invoice is attached) attachment 10.

The same truck had refueled the following airplanes on the same date:

- EgyptAir aircraft A320 SU-GBF at 02:05 LT before the accident aircraft.
- Taroum aircraft YR-GGX at 04:20 LT after the accident aircraft.
- EgyptAir aircraft SU-GCD at 05:10 LT after the accident aircraft.

After the aircraft accident, Three fuel samples had been drawn from the Misr Petroleum fuel truck on January 3rd, 2004 at 12:45 local time. One of them was used for a dehydrated Copper Sulfate capsule field inspection for fuel water content, which was satisfactory (attachment 11). The two others samples were sent to the following laboratories for analysis:

- The Egyptian Petroleum Research Institute Nasr City, Cairo (attachment 12).
- Misr Petroleum Company, Ghamra Research Center Laboratory (attachment 13).

The Egyptian Petroleum Research Institute (EPRI) performed the Jet (A-1) fuel analysis, ASTM distillation and ASTM D-86. The results of these analyses show that all the values are within limits except for the water content, ppm, which is 48, and the max is 30.

The Misr Petroleum Co, Ghamra Research Center Laboratory performed the same analyses done by (EPRI), all the results comply with the requirements of DES-STAN 91-91 issue 4 (DERD 2494) and the joint fueling systems "Checklist" specifications for JET A-1 issue 19 Sept, 2002.

Appendix A

Attachment Listing

Attachment 01: List of Checks done on the accident aircraft.

Attachment 02: Engine Disks and first limiters status

Attachment 03: Airworthiness compliance status.

Attachment 04: Components list replaced by Flash Airlines.

Attachment 05: Copy of the Tech Log Book Entry Listing.

Attachment 06: Eng [REDACTED] Interview.

Attachment 07: EgyptAir Contract

Attachment 08: Braathens Engineering and Maintenance Contract.

Attachment 09: Snecma Morocco Contract

Attachment 10: Fuel Service Invoice.

Attachment 11: On spot fuel field inspection.

Attachment 12: Egyptian Petroleum Research Institute Analyses Report.

Attachment 13: Misr Petroleum Co, Ghamra Laboratory analyses report.

Attachment 14: Engine Condition Monitoring Cruise Trend Sheets.

Attachment 15: Type Certificate Data Sheet.

Attachment 16: Supplemental Type Certificate, STC.

Attachment 17: Service Bulletins compliance list

Exhibit B

Flight Data Recorder (FDR) Group Factual Report

Ministry of civil aviation
Accidents Department
Egypt, Cairo

October14, 2004

Group Chairman's Factual Report - Flight Data Recorder

ACCIDENT

Location:	Red Sea off Sharm el-Sheikh
Date:	January3, 2004
Time:	2:45:06 GMT
Operator:	Flash Airlines – Flight 604

The group convened at MCA headquarters in Cairo from January16, 2004 for readout of the FDR. The readout included transcription of the accident flight data. In addition, a transcription of the entire 25-hour contents of the FDR was accomplished.

SUMMARY

On January 3, 2004, about 02:45:06 UTC, 04:45:06 Local time, Flash Airlines flight FSH604, a Boeing 737-300, Egyptian registration SU-ZCF, operated by Flash Airlines, crashed into the Red Sea shortly after takeoff from Sharm el-Sheikh International Airport (SSH) in South Sinai, Egypt. The flight was a passenger charter flight to Charles de Gaulle Airport (CDG), France with a stopover in Cairo international Airport (CAI) for refueling. Flight 604 departed from Sharm el-Sheikh airport with 2 pilots (Captain and First Officer), 1 observer, 4 cabin crew, 6 off-duty crew members and 135 passengers on board. The airplane was destroyed due to impact forces with the red sea with no survivals.

Details of Investigation

- The accident airplane's flight data recorder (SSFDR), part number 980-4120-DXUN S/N 10069, was retrieved from the Red Sea on January16, 2004 by the French Navy. The FDR was immersed in water and sealed in an ice chest and transported to MOCA, accident investigation laboratory at Cairo.

- Readout of the FDR was accomplished using the laboratory's playback hardware, Hand held Down Load unit manufactured by ALLIED SIGNAL Part No. 964-0446-001 and recovery/ analysis/ presentation system (RAPS) software.
- Inspite of the damage that had occurred to the external case of SSFDR, the internal solid state memory was in good condition and all the available data was retrieved. RAPS considered the recorded signal and data quality to be very good.
- Data plots and tabular listings of each data parameter for the entire accident flight are included in this report. The entire 25-hour contents of the FDR were also transcribed, and the data provided to the parties to the investigation.

After the cockpit voice recorder (CVR) timing had been compared to the SSFDR vhf microphone keying and Autopilot disengages warning, a time correlation was developed.

Unreliable parameters

- **Control Wheel Position**

The position of the control wheel is sensed by a position transmitter mounted under the flight deck floor. The transmitter measures the rotation of a shaft that is connected to the lateral control system with a cable and pulley arrangement. The body of the transmitter is cylindrical and is held in place by a clamp. The output may be adjusted by rotating the body of transmitter within clamp which is then tightened. The recorded position of the control wheel tended to follow the recorded position of the ailerons, and therefore appears to have the correct profile. However there was an offset or bias between the recorded position and the expected position. The value of the bias changed at irregular intervals, often when large control wheel inputs were made, and also every time that a control wheel freedom-of-motion check was conducted prior to takeoff. The shifting bias was evident in all 25 hours of FDR data.

- **Left Engine N1**

The fan speed of the left engine appears to behave normally during the first 17 hours of recorded data. During the last 8 hours (including the accident flight), the parameter recording fan speed alternates between two fixed values. All other engine parameters

for both the left and right engine are operating normally. The aerodynamic performance and simulation match discussed in section 1.16 indicates that the left engine was operating normally.

- **Slat #1 Mid Extend Discrete**

Slats position is recorded by three discrete parameters as follows:

- “Slats full extended”
- “Slats in transit”
- “Slats mid extended”

. Normally, during cruise, the slats are up, during takeoff, the slats are in the mid-extend position to provide increased low-speed lift capability. During landing, the slats are normally in the fully extended position to further increase low-speed lift capability. The position of each slat is indicated by discrete parameters on the FDR. With the exception of the "LE Slat 1 Mid Extend" parameter, all of the slat indications recorded on the FDR change in a consistent manner

Comments

- 1) The transition of the Air/Ground discrete parameter from “Ground” to “Air” had occurred at 2:42:33 GMT, the last recovered data was recorded at 2:45:5 GMT.
- 2) TOGA mode had been engaged at 2:42:02 GMT for two seconds, and then disengaged. While checking the TOGA mode operation all over the FDR 25 Hr. Data, We notice that every time the mode engaged, one second or two seconds later disengage.
- 3) During takeoff with the aircraft magnetic heading constant, the right aileron indication was up and the left aileron indication was down.
- 4) Heading Select and Level Change modes had been selected as Flight director modes.
- 5) The FDR data indicates that the airplane was turning to the left after takeoff, and rolling back towards wings level before the autopilot engagement.
- 6) The autopilot had been engaged at 2:43:59 GMT and disengaged at 2:44:02GMT. At 2:44:03 GMT, the autopilot disengage warning was recorded.
- 7) At autopilot engagement, the Heading Select Mode was disengaged and reverted to CWS R Mode.
- 8) Between the time of the autopilot engagement and disengagement, the FDR records momentary aileron surfaces movements. The right aileron deflected to 7.2 degree TEU for one second.

- 9) After autopilot disengagement, the aircraft had turned to the right and on the other hand the ailerons repetitively moved between the neutral and the roll right direction.
- 10) At 2:44:58GMT, the aircraft roll angel reached 111.094° to the right, next second both ailerons reversed their directions and initiated aircraft recovery.
- 11) Hydraulic pressure, Engine Oil Quantity, Speed Brake Handle Position, Selected Heading and Selected Course no.1 Parameters were retrieved according to Boeing Document "Enclosure B-H200-17884-ASI"

Attachments:

- A- Attachment 1, Tabular data of the accident flight.
- B- Attachment 2, FDR Plots
- C- Attachment 3, Five plots represent FDR and CVR correlation.

Note: Soft Copy for all 25 hours FDR data is available at MCA upon request

Attachment 1, Tabular data of the accident flight.

Accidents Department
Egypt, Cairo**

October14, 2004

Group Chairman's Factual Report – Cockpit Voice Recorder

ACCIDENT

Location:	Red Sea off Sharm el-Sheikh
Date:	January3, 2004
Time:	2:45:06 GMT
Operator:	Flash Airlines – Flight 604

The group convened at CVR/FDR laboratory at MCA headquarters - Cairo for retrieval of CVR conversation and aural sounds.

SUMMARY

On January 3, 2004, about 02:45:06 UTC, 04:45:06 Local time, Flash Airlines flight FSH604, a Boeing 737-300, Egyptian registration SU-ZCF, operated by Flash Airlines, crashed into the Red Sea shortly after takeoff from Sharm el-Sheikh International Airport (SSH) in South Sinai, Egypt. The flight was a passenger charter flight to Charles de Gaulle Airport (CDG), France with a stopover in Cairo international Airport (CAI) for refueling. Flight 604 departed from Sharm el-Sheikh airport with 2 pilots (Captain and First Officer), 1 observer, 4 cabin crew, 6 off-duty crew members and 135 passengers on board. The airplane was destroyed due to impact forces with the red sea with no survivals.

Details of Investigation

- The accident airplane's Cockpit Voice data recorder (CVR), Fairchild, Part no. 93-A100 – 80, serial no. 57994 was retrieved from the Red Sea on January17, 2004 by the French Navy. The CVR was immersed in water and sealed in an ice chest and transported to MCA, accident investigation laboratory at Cairo.
- Readout of the CVR was accomplished using the laboratory's playback hardware and software as follow:

Download Unit:

A100 CVR play back Deck - Store 4DS

Audio Analysis System:

MPL 1024 , 12 Channel Microphone Mixer – Samson

Filter : PCAP II (Samson)

Amplifier : Samson - Servo-550 Studio Amplifier

Software:

Vegas 4 – Sound Forge 6 –PCAP II

- The recorder consisted of four channels of audio information.

Channel One:	First officir hot mic.
Channel Two:	Area Mic.
Channel Three:	Observer hot Mic.
Channel Four:	Captain hot Mic.

- After the initial retrieved sound task was completed another effort was undertaken with the assistance of BEA expert as follows:
 - The output signal from the tape deck playback machine was too low compared to the recording on the same conditions in BEA. This problem was solved by increasing the output level when the screw of the adjustable gain control was turned clockwise.

 - The sensitivity of the acquisition audio card of the PC was not good enough to capture correctly the audio signal coming from the tape deck player. This problem was solved by changing the value of the “Variable Signal Levels” on the hardware setting of the audio card, from the manufacture value +4 to -10. The gain was increased and the input signal amplified.

 - The speed of the tape was not correct with an interference of the power (115 V, 400 Hz) measured at 375 Hz. It was not possible to adjust properly the speed of the tape with the device installed. This problem is solved by resembing the wave file with a correct ratio ($400/375= 1.0665$).

 - Some high frequencies were missing when doing the spectrum analysis. This problem was solved by using a sampling rate of 32000 kHz instead of 22000 kHz.

 - The alignment of the head installed on tape deck player was checked, adjusted and was found satisfactory prior to playback the tape.

A new copy of the CVR was performed. This recorded copy is satisfactory.

- Due to the effect of aircraft power (115 V, 400 Hz) on the tape speed, the data had been retrieved at a sample rate 34128 HZ. Recording time of the Subject CVR measured found 31 min. and 13.7 sec. and the frequency was 402 HZ

Comments

- Before start check list, below the line, Engine start, after start check list, and before Takeoff check list down to strobe lights are carried out.
- During flight control check at 02:37:40, two consecutive sounds had occurred, following at 02:37:41 the Captain had announced "turning to the right".
- Before the engine started, sound similar to Cockpit door operation was heard and no body other than the Captain, the First officer and the Extra crew1 was in the cockpit till the end of the CVR tape.
- At 02:42:43, the Captain requested for "Four Hundred Heading Select". One second later the First Officer acknowledged "Four Hundred Heading Select"
- At 02:42:484, the Captain had asked for "Level Change". One second later the First Officer repeated "Level Change".
- At 02:43:04 and at 02:43:11, the captain had announced "Left Turn". One second later the First Officer repeated " Left turn to establish Three Zero Six Sharm VOR"
- At 02:43:55, the Captain had asked for "Autopilot". At 02:44:00, The First officer announced "Autopilot in command" and at 02:44:02, the sound of autopilot disengages warning was heard.
- At 02:44:05, the Captain had asked for "Heading Select". At 02:44:07, the First Officer repeated "Heading Select"
- AT 02:44:27, the First Officer had announced "Turning right Sir" and again at 02:44:31, he confirmed "Aircraft is turning right".
- At time 2:44:35 Captain said "turning Right?"
- At time 2:44:37 Captain said "how turning right"
- At 02:44:41.7 and at 02:44:43.4, the Captain had asked for "Autopilot", and at 02:44:44 the First Officer replied "Autopilot in command"

- At 02:44:46, the Captain had asked for "Autopilot", and at 02:44:56, the First officer replied "No autopilot Commander" but again the Captain in command asked for "Autopilot".
- The phrase "Come out" was repeated three times by the captain at 02:44:41, 02:44:53.4 and 02: 45:04.3
- Extra crew 1 did not interfere during flight progress except at 02:44:58.8 when he had been announced "Retard Power, Retard Power, Retard Power"

Transcript of a Fairchild A-100 cockpit voice recorder (CVR), serial no. 57994 installed on a B-737-500, SU-GZF, which was involved in a descent and collision into the Red Sea near Sharm on Jan, 2004

02:13:53	ATC	Communication with Blue Panorama B757 (●●●) for 31 seconds
02:14:27	Extra crew1	طردوه ياعم مش عايزينه يقعد طول الليل هنا <i>They don't want him to stay here all night</i>
02:14:30	First officer	ممکن حضرتك علشان بيودوهم عند الهناجر <i>May be because they move them next to the hanger</i>
02:14:32	Extra crew1	لا قالوه حبيعتوه للغردقة * <i>They told him they will send him to Hurgada</i>
02:14:43	First officer	بص خلاص علشان انا شايف يعنى الترافك بدأ يقل فى اليومين دول <i>The traffic started to decrease</i>
02:14:47	Extra crew1	والله <i>Really</i>
02:14:48	First officer	آه مش <i>yes</i>
02:14:49	Extra crew1	انا افكرته على جذا <i>I thought it was still high</i>
02:14:50	First officer	لا احنا نازلين حاضرتك امبارح مثلاً الساعة خمسة ومن خمسة لغاية ستة المطار زى كدة بالضبط <i>No we are decreasing</i>
02:14:59	Extra crew1	ياه <i>Really</i>

UTC hh:mm:ss	Speaker	Content
02:15:02	First officer	ده بالعكس كله دلوقتي بيبتدى بقى يسافر خلاص كله قضى رأس السنة و الكريسماس <i>Every body is going back after Christmas & new year</i>
02:15:07	Extra crew1	آه <i>yes</i>
02:15:21	Extra crew1	بوينج سبعة وخمسين <i>Boeing seven five seven</i>
02:16:02	First officer	بقول لحضرتك كابتن عصام يعنى استاذى يعنى <i>I am telling you sir captain Essam is my teacher</i>
02:16:10	Extra crew1	والله !!! <i>Really</i>
02:16:13	First officer	حضرتك كان مسمينى حتى "مازو" على اسم ابنه الصغير لو حضرتك تعرفه على اساس كنت ابتديت الطيران صغير <i>He even calls me like his youngest son</i>
02:16:24	Extra crew1	ابتديت ازاي <i>How did you start</i>
02:16:26	First officer	انا ابتديت حضرتك خلصت تمتاشر طبعا كوميرشيوال وقعدت حوالى سنة ونصف ابتديت قبل العشرين كده <i>I started by finishing commercial at eighteen and stayed for a year and half and started before twenty</i>
02:16:35	Extra crew1	آه <i>yes</i>
02:16:43	First officer	احسن حاجة فادتنى طبعا ان انا ابتديت على الميتين يعنى الميتين ده مدرسة <i>The best benefit was my starting on the two hundred</i>

UTC hh:mm:ss	Speaker	Content
02:16:46	Extra crew1	آه دراسة يعنى مش حظ <i>Yes studying not luck</i>
02:16:47	First officer	الحمد لله يعنى <i>Thank god</i>
02:16:52	Extra crew1	انا عايش بره <i>I live abroad</i>
02:16:54	First officer	* حضرتك <i>you sir</i>
02:16:55	Extra crew1	ياه ما عندناش النظام ده خالص لازم تعمل ألفين ساعة قبل ما حد يبصلك يعنى <i>You must have two thousand hours before anyone looks at you</i>
02:17:04	First officer	فين حضرتك <i>where sir</i>
02:17:05	Extra crew1	اشتغل مدرب شوية اشتغل رش شوية اشتغل bush pilot <i>Work as instructor a bit and a bit as bush pilot</i>
02:17:10	First officer	بس كلها إكسبيرينس عالية <i>But it is all high experience level</i>
02:17:12	Extra crew1	اكسبيرينس بس بتشتغل على طيارات صغيرة وسنجل إنجين ، ما بتخدش الإكسبيرينس اللي هو يعنى تقعد انت خمس سنين كده بتضيعهم أونطة يعنى بس انا زيك انا كنت دفعة تسعة وثمانين حتى كان عندي تمتناشر سنة حتى كان عندي يعنى كان لازم اجيب موافقة من بابا ومش عارف إيه <i>It is all experience but it is a waste of time</i>

Airplane Performance Group Factual Report

Ministry of civil aviation
Accidents Department
Egypt, Cairo

October14, 2004

Group Chairman's Factual Report - Performance

A. ACCIDENT

Location: Red Sea off Sharm el-Sheikh
Date: January3, 2004
Time: 2:45:06 GMT
Operator: Flash Airlines – Flight 604

The group convened at MCA headquarters in Cairo from January15, 2004 for performance Factual Data collection

B. SUMMARY

On January 3, 2004, about 02:45:06 UTC, 04:45:06 Local time, Flash Airlines flight FSH604, a Boeing 737-300, Egyptian registration SU-ZCF, crashed into the Red Sea shortly after takeoff from Sharm el-Sheikh International Airport (SSH) in South Sinai, Egypt. The flight was a passenger charter flight to Charles de Gaulle Airport (CDG), France with a stopover in Cairo international Airport (CAI) for refueling. Flight 604 departed from Sharm el-Sheikh airport with 2 pilots (Captain and First Officer), 1 observer, 4 cabin crew, 6 off-duty crew members and 135 passengers on board. The airplane was destroyed due to impact forces with the Red Sea with no survivals.

The airplane had departed from Sharm el-Sheikh runway 22R and was air born at 02:42:33 UTC, approximately 2½ minutes prior to the crash, and had been cleared for a climbing left turn intercept the 306 radial from the Sharm el-Sheikh VOR station located just north of runway 22R. This climbing turn allows departing flights to gain sufficient altitude before proceeding over higher terrain located along the flight path to Cairo. Flight 604 was operating in Egyptian airspace as a charter flight operating under the provisions of Egyptian Civil Aviation Regulations Part 121

C. DETAILS OF THE INVESTIGATION

The purpose of the Aircraft Performance Group (ACPG) is to collect the factual information to determine and analyze the motion of the aircraft and the physical forces that produce that motion. In particular, the Group attempts to define the aircraft position and orientation throughout the flight, and determine its response to control inputs, system failures, external disturbances, or other factors that could affect its trajectory. The data the ACPG uses to obtain this information includes but is not limited to the following:

- Wreckage location and condition.
- Aircraft Surveillance Radar (ASR 12) Radar Data.
- Digital Flight Data Recorder (DFDR) data.
- Cockpit Voice Recorder (CVR) information.
- Weather information.
- Weight and Balance Data.
- Tests and Researches

C.1 Wreckage Location and Condition:

Refer to the Wreckage and Impact Factual Information

C.2 Radar Data

Sharm el-Sheikh Radar

- General Specifications:

ASR 12 Radar (Aircraft Surveillance Radar)

Secondary 250 nm

Primary 60 nm

15 Revolution Per minutes approximately (Scan time = 4.13 sec)

Radar site location: 2758.057n/ 03421.985e (Lat. 27.96762 Degree north, Long. 34.36642 Degree east)

Radar Elevation: 299.3 ft

C4. Cockpit Voice Recorder (CVR) information.

Refer to FDR Factual Report

C5. Weather Information

Sharm El Sheikh does not provide Automatic Terminal Information Service (ATIS).

The SSH weather at 0200Z was reported as:

270 degrees at 06 knots, ceiling and visibility OK (CAVOK), temperature 17 degrees Celsius, dew point minus 6 degree Celsius, altimeter 1011 HectoPascals (hPa), No significant change (NOSIG).

The SSH weather at 0300Z was reported as:

280 degrees at 08 knots, ceiling and visibility OK (CAVOK), temperature 17 degrees Celsius, dew point minus 6 degree Celsius, altimeter 1011 HectoPascals (hPa), No significant change (NOSIG).

C6. Weight and Balance Data.

According to the Egyptian Civil Aviation Regulations, ECAR 91 Appendix H attachment 1 the aircraft has to be reweighed every three years. Furthermore, aircraft must be reweighed if the effect of modifications on the mass and balance is not accurately known. Flash Airlines aircraft was weighed last time on December 19, 2002 in Braathens SAFE, Stavanger, Norway and recalculated by Flash Airlines after the reinforced cockpit door modification installation on November 1st, 2003, and the results were as follows.

Empty Weight	:	70794 lbs
Moment	:	45921358.6 lb.in
% AMC	:	17.42%

The Flash Airlines weight and balance calculations provided to the flight crew contained the following information¹:

	Weight (kilograms)	
Total Traffic Load	11,450 ²	
Dry Operating Mass	33,200	
Actual Zero Fuel Mass	44,650	
Maximum Zero Fuel Mass	47,627	
Takeoff Fuel	7,000	
Actual Takeoff Mass	51,650	
Maximum Takeoff Mass (Certificate Limi	63,276	
Landing Mass	49,650	
Maximum Landing Mass (Certificate Limi	51,709	

Zero Fuel Mass Center of Gravity (CG)	20.0%	
Zero Fuel Mass CG Limits ³	8.0% Forward	28.4% Aft
Takeoff Mass CG	18.0%	
Takeoff Mass CG Limits ⁴	6.7% Forward	27.9% Aft

¹ See attached Flash Airlines Load and Trim Sheet.

² A review of the Load and Trim Sheet indicated a low 100-kilogram error. The total cargo weight plus passenger mass (Total Traffic Load) should be 11,550 kilograms. Correspondingly, the Zero Fuel Mass, Takeoff Mass, and Landing Mass will be low in error by the same 100-kilogram Mass.

³ Estimated Zero Fuel Mass CG limits were derived from Flash Airlines Load and Trim sheet index chart based upon a Zero Fuel Mass of 44,650 kilograms.

Stabilizer Trim settings for takeoff were:

Flaps 1 or 5 4 ¾ Units
Flaps 15 3 ¾ Units

According to the Flash Airlines Flight Operations Manual Chapter 6, Paragraph 6.1.8.3, Passenger and Baggage Masses, the following chart was published:

	Male	Female
All flights except	88kg	70kg
Holiday	83kg	69kg
Children	35kg	35kg

A review of the accident Load and Trim Sheet indicated a Passenger Mass of 9,450kg. If 350kg is removed for 10 children (10 x 35kg) the result is 9,100kg. Dividing the 125 adult passengers into the 9,100kg would give an average value of 72.8kg per adult passenger.

Using the table above, and assuming 50% Male and 50% Female adult passengers, the worst-case difference in weight calculation would be the following:

The average weight of male and female for all flights except would be $88\text{kg} + 70\text{kg} / 2 = 79\text{kg}$ per adult passenger.

$$79\text{kg} \times 125 \text{ passengers} = 9,875\text{kg}$$

This represents an increase in weight of 775kg.

Using this value for Load and Trim calculations provided the following information:

Takeoff CG 18.2%MAC
Zero Fuel Mass CG 20% MAC
Takeoff Trim (flaps 5) 4 ¾ Units

These worst-case differences in values for passenger weight still fall within structural and calculated limitations for the airplane.

⁴ Estimated Takeoff Mass CG limits were derived from Flash Airlines Load and Trim sheet index chart based upon a Takeoff Mass of 51,650 kilograms.

C7. Tests and Research

The FDR records the movements of the pilot's controls (e.g. control column, control wheel position and rudder pedals), the movement of the control surfaces (e.g. elevator, aileron and rudder) as well as motion of the airplane (e.g. pitch and roll attitude and heading angle). The performance evaluation was conducted to determine if the control surfaces were responding normally to the pilot's controls and if the airplane was responding normally to movement of the control surfaces.

In order to accomplish this work, Boeing's 737-300 aerodynamic simulation model was used to recreate the accident flight. The simulation calculates the response of the airplane to movement of the flight control surfaces – for example, it can calculate the roll rate resulting from a 10 degree deflection of the ailerons. The simulation has been verified by comparison against actual flight test data and was used for the design and certification of the 737-300 airplane. In addition, the simulation is the basis for 737-300 crew training simulators used around the world. It should be noted that the 737-300 simulation model is essentially a computer program that represents a nominal airplane with nominal engines. Small differences between the simulation and individual airplane's behavior are common and expected due to differences in control surface rigging, engine wear, and other normal tolerances.

Performance Evaluation

FDR data are recorded at relatively low sample rates and are recorded from different sources, some of which have inherent biases. Because of these issues, a kinematic consistency (KINCON) process was used to supplement the FDR data and calculate additional parameters to be used in the performance analysis. Kinematic consistency analysis is a general practice for processing flight data (either flight test data or FDR data) to ensure consistency of position, speed, and acceleration data.

C7.1 Baseline Simulation

A baseline simulation recreation of the accident flight was started just as the airplane turned onto the runway and the throttles were advanced, and the simulation was stopped at the end of the FDR data. Because the simulation can calculate the response of the airplane to control inputs, a set of control input time histories (column, wheel, and rudder movements) can be determined that results in the simulation following the same path as the accident airplane. It is important to note that this process does not use the control or surface position data recorded on the FDR, only the path information (e.g. accelerations, attitude and altitude).

Comparisons between the recorded FDR data and the simulation time history data are provided for longitudinal and lateral/directional data in Figures Figure C7-1 and Figure C7-2 respectively.

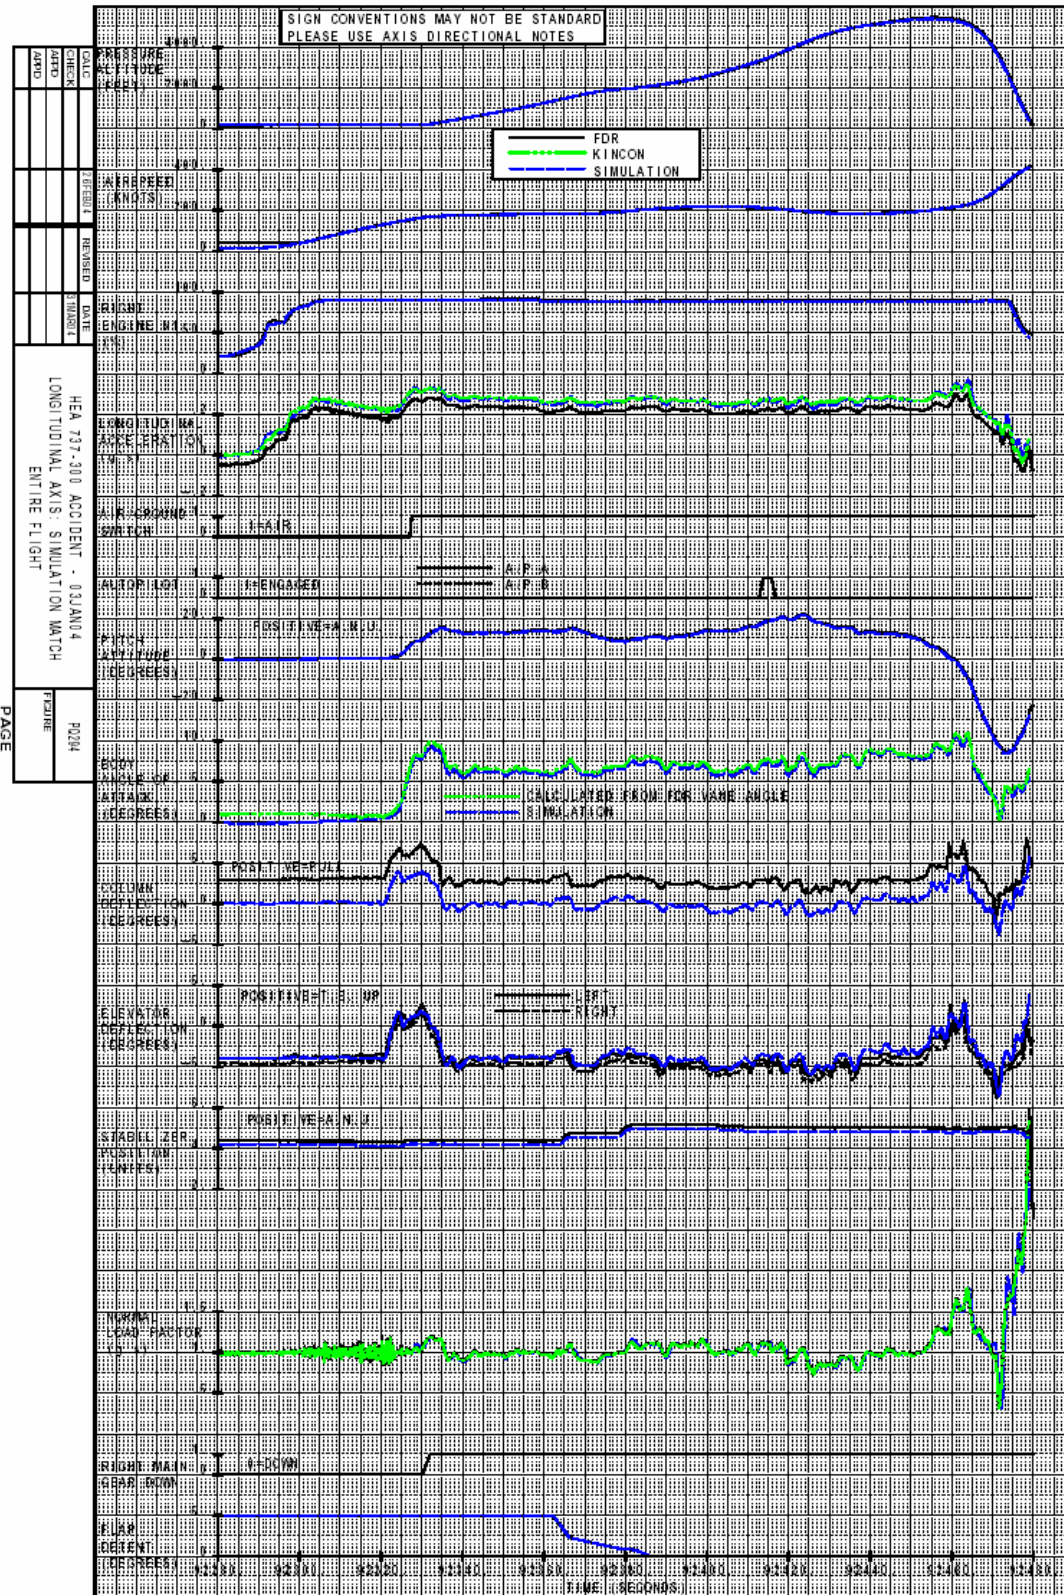

Figure C7-1 – FDR and Simulation Match Data – Longitudinal Axis

An examination of the baseline simulation revealed that the path of the accident airplane is consistent with the recorded motion of the control surfaces. Specifically, the extreme bank attitude that occurs towards the end of the flight is consistent with recorded motion of the ailerons.

The simulation also revealed that the motion of the control surfaces is consistent with the recorded motion of the control inputs, with the exception of control wheel

C7.2 Hypothetical Faults resulting in a rolling moment

Several hypothetical airplane system faults were examined to determine if any could have resulted in the right roll behavior recorded on the FDR. These faults included:

- Uncommanded deployment of the #1 slat
- Uncommanded spoiler deflection to full travel (hardover)
- A spoiler disconnected from its actuator (spoiler float)
- Flap asymmetry
- Thrust asymmetry
- Unrecorded rudder motion

The hypothetical faults listed above are similar in that they each create a rolling moment unrelated to the position of the ailerons that will cause the airplane to bank. That is to say, if one of these faults had occurred, the path of the airplane would have differed from that predicted by the recorded position of the ailerons.

Multi-Purpose Engineering Cab Simulator

Additional tests were conducted at Boeing's multi-purpose engineering cab simulator or M-Cab. The M-Cab is similar to a flight crew training simulator in that it consists of a realistic flight deck mounted on a movable base. The M-Cab includes a visual system providing out-the-window views to the flight crew. Because the M-Cab is used to simulate the flight deck of many different Boeing models, actual flight instruments are not used. Instead, a large LCD display is programmed to simulate the flight instrument displays. Examples of the M-Cab's flight instrument displays for the 737-300 are shown in section 1.6.2.

Major differences between the M-Cab and a typical flight crew training simulator are listed below.

- The M-Cab can simulate different model airplanes including 707, 727, 737, 747, 757, 767, and 777.
- The M-Cab can be reprogrammed to simulate a wide variety of hypothetical aircraft system faults.
- The M-Cab can be "backdriven" to reproduce recorded data, such as the simulation match to the accident flight discussed in section 1.16.2. In addition, the backdrive can be interrupted at any point with a transition to normal simulator operation at the current flight conditions. This capability (known as "breakout" allows pilots in the simulator to attempt to recover the airplane from various points in the accident profile.
- The operation of the M-Cab is recorded at a high sample rate

The M-Cab was used to recreate the accident flight as well as to study a number of hypothetical airplane system faults.

Tests conducted in the M-Cab

The M-Cab was used to examine some of the faults mentioned in section 1.16.3, as well as a number of other hypothetical faults affecting the lateral control system or the autopilot system. M-Cab tests included:

- Backdrive of FDR data
- Backdrive with breakout at 02:44:44
- Backdrive with breakout at 02:44:56
- Spoiler float
- Uncommanded aileron trim to full authority
- Uncommanded aileron trim to half authority
- Autopilot servo actuator hardover without force limiter engaged
- Autopilot servo actuator hardover with force limiter engaged
- Autopilot servo actuator hardover with pressure regulator and relief valve inoperative

The tests in the M-Cab were conducted with an out-the-window scene equivalent to that available to the accident pilots with the following exceptions:

- 1) The visibility conditions simulated (ceiling and visibility unlimited at night with no moon) were those reported at the airport at the time of the accident. Actual visibility conditions on the flight deck at the time of the accident are unknown.
- 2) The ground in the vicinity of Sharm el-Sheikh was depicted through the use of satellite photography taken during daylight hours. It did not represent the nighttime scene of street lights, building lights, etc. against an otherwise dark landscape.

Exhibit E

Site and Wreckage Group Factual Report

Site and Wreckage Group Report

1. Summary of the Accident

On 3 January 2004, Flash Airlines flight FSH604, a Boeing 737-300 registered as SU-ZCF, operating as a chartered flight from Sharm el-Sheikh, Egypt to Paris, France, via Cairo departed from Sharm el-Sheikh airport (SSH) at approximately 02:40 UTC. The airplane crashed into the Red Sea approximately 6 nautical miles southwest of the airport at approximately 02:44 UTC.

2. Scope of Site and Wreckage Group Field Notes

The scope of this report is the recovery operations that took place from 3 January 2004 through 28 January 2004 in the Red Sea off Sharm el-Sheikh, Egypt and initial inspection for the recovered parts. Recovery operations initially consisted of the recovery of floating wreckage elements only. Recovery of the underwater wreckage (including FDR and CVR) began when the first ship equipped with a suitable Remote Operated Vehicle (ROV), arrived at the accident scene on 11 January 2004.

This report provides a summary of the recovery operations and documents the wreckage that was identified and recovered.

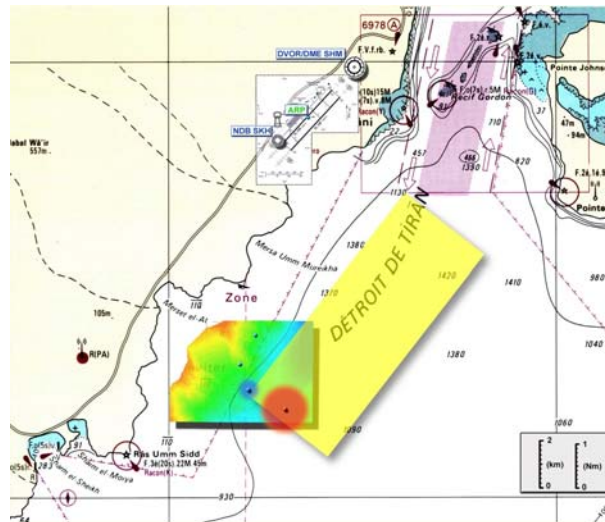

3. Recovery Operations

3.1 Survival aspects

The initial search for possible survivors and the recovery of bodies were priorities for the rescue and investigation teams. Rescue teams were on site minutes after the accident. They searched for survivors but due to the high energy impact of the aircraft with the sea surface, the depth of the water in this area, their efforts were unsuccessful in recovering any survivors.

Efforts were made to locate human remains by use of deep sea cameras and robots but were also not successful due to the location of the wreckage and the depth of more than 1000 meters.

3.2 Floating Wreckage

The floating wreckage which was recovered shortly after the crash was stored in a hangar in Sharm el-Sheikh airport. On 11 January 2004, the Site and Recovery Group met in the hangar for wreckage inspection. The wreckage was then identified (as much as possible), inspected, segregated (aircraft parts or personal effects). Later, the personal effects were transferred to the Egyptian Legal Authority in Sharm el-Sheikh. A database for the floating wreckage was created (including wreckage pictures).

3.3 Underwater Wreckage

Because of the depth of the Red Sea in the area where the accident occurred (approximately 1000 meters), specialized recovery resources were required for the submerged wreckage. The French vessels "Ile de Batz" and "Janus II" were contracted to conduct the underwater wreckage survey and recovery. Both vessels were equipped with deep water recovery capabilities consisting of submersible Remotely Operated Vehicles (ROV). The necessary support equipment to accurately locate and map the airplane wreckage was provided by the French Navy. An oceanographic vessel, the "Beautemps-Beaupré" was sent to the accident site to undertake a bathymetry (depth mapping) of the seabed and a survey of tidal currents.

3.4 FDR / CVR Recovery

The initial focus of the underwater recovery operation was finding and retrieving the protected recorders, the Cockpit Voice Recorder (CVR) and Flight Data Recorder (FDR) and mapping the searched areas. Each recorder is equipped with an acoustic transmitter, called a “pinger” that transmits a detection signal that can be used to locate the box. Based on the initial determination of pinger locations, the ROV from Ile de- Batz, Scorpio, began a visual search using its cameras to find the recorders. To refine the location of the pingers, a network of sonobuoys (GIB, GPS Intelligent Buoys), (see Exhibit E Attachment 4 for detailed description of this operation), was employed in a cooperative effort between the French and Egyptian Navies. This method produced a new pinger position accurate to within 10 meters and the ROV was moved to the new location. A visual search of a grid created around the new pinger location resulted in discovery of the FDR on 16 January 2004. The FDR was recovered by the ROV and taken onboard the Ile de Batz. Custody of the recorder was transferred to the Investigator in Charge (IIC) at the port of Sharm El Sheikh.

The pinger of the second recorder (CVR) was initially identified approximately 800 meters north of the first pinger. However, it was decided to continue the visual search using grids in the area where the first recorder was found. This search was successful and resulted in finding of the CVR on 17 January 2004 (approximately 24 hours after the FDR). It was also taken onboard the Ile de Batz and custody was transferred to the Investigator in Charge (IIC) at the port of Sharm El Sheikh.

FDR underwater Location: N27 52.3605, E34 22.0165.

CVR underwater Location: N27 52.3467, E34 22.0207.

The recorders were both sent to Cairo for read out and analysis.

The focus of the recovery operation then changed to detailed mapping of the wreckage and recovery of selected airplane equipment. In addition, the recovery operation included recovery of any equipment deemed important to the investigation based on the review of the FDR and CVR in Cairo.

3.5 Wreckage Mapping

During the structured search for the recorders, the position (latitude and longitude) and description of surveyed wreckage was recorded. Following recovery of the FDR and CVR, additional grids were defined for ROV operations. These grids were used to systematically survey and document the entire wreckage area. The positions of large pieces, such as the three landing gears and the cores of the two engines were identified.

Data from both ships involved in mapping and recovery were consolidated into a single listing of all surveyed wreckage, which is included herein as Exhibit E Attachment 5.

The distribution of wreckage is included within a rectangle of approximately 275 by 440 meters defined by the following corner point coordinates:

North corner:	N 27°52,559	E 34°21,933
East corner:	N 27°52,410	E 34°22,126
South corner:	N 27°52,294	E 34°22,022
West corner:	N 27°52,450	E 34°21,817

Multiple surveys of the area confirmed the containment of the wreckage within these established boundaries.

3.6 Recovered Wreckage

The investigation team developed a strategy for wreckage recovery based on the review of the FDR and CVR undertaken in Cairo. Flight control actuation components and flight deck systems were considered as a priority.

A system was developed for recording the description, external dimensions and the location, in latitude and longitude coordinates, of all recovered wreckage pieces. A database of recovered floating wreckage is included herein as Exhibit E Attachment 5. Another database documenting all wreckage recovered by Ile de Batz and Janus II is included as Exhibit E Attachment 5. Both databases reference digital images of all floating and recovered wreckage.

Recovered wreckage was stored aboard the ships in sea water until taken ashore and loaded onto trucks. All of the recovered wreckage is stored in a hangar at Sharm El Sheikh Airport and is under the control of the investigative authorities.

4. Partial list of the Recovered Wreckage

- Parts of the horizontal stabilizer central section structure (called “Texas Star”), elements of the elevator structure and components of the elevator control system, including both elevator PCU's (Power Control Unit), both autopilot actuators, the feel and centering unit including the feel actuator.
- Horizontal stabilizer jackscrew and actuator gearbox.

- Vertical stabilizer structure with rudder control system components, including the main rudder PCU and standby rudder PCU, the feel and centering mechanism and with the trim actuator.
- Aileron PCU, spoiler mixer and TBD spoiler actuators.

5. Initial observations

- The two engines were found approximately 24 meters apart
- The left and right main landing gear assemblies were found in between the two engines
- The recovered thrust reverser actuator was found retracted
- The recovered leading edge flap actuator was found retracted
- The recovered trailing edge flap jackscrew indicates that flaps were retracted
- The stabilizer jackscrew was measured at 7.5 inches between the flat of the ball nut and the flat of the end stop which corresponds to a stabilizer leading edge position between 2 and 3 degrees down or a trim unit setting between 5 and 6 pilot units.¹

6. Wreckage Data bases and Photos

The full data base and photos of the wreckage are on a CD, which is available at the Egyptian Civil Aviation Ministry (MCA). This CD contains:

- a. A folder with three Excel files for wreckage complete data base.
 - i. Floating Wreckage data base.
 - ii. Recovered Wreckage data base.
 - iii. Underwater Surveyed Wreckage data base.
- b. A folder for photos with four sub-folders
 - i. Floating Wreckage Photos: 104 photos.
 - ii. Recovered Wreckage Photos: 98 photos.
 - iii. Underwater Surveyed Wreckage Photos: 330 photos.
 - iv. Wreckage Recovery Process Photos: 25 photos

**Use of a GIB System For
Recorders Recovery**

Use Of A GIB System For Recorders Recovery

A flight recorder immersed under water can be located by the signals (1 bip/second with 37,5 kHz (± 1 kHz)) transmitted by the ULB beacon (pinger) attached to the recorder. This pinger starts as soon as it is in contact with water and is designed to transmit this signal for at least thirty days.

The French Navy used an acoustic detector assembled on a pole called "Helle" which tracks signals on frequencies ranging from 7 to 50 kHz. This detector has two reception antennae, one omni-directional and the other directional. It was connected to an audio system that controlled the frequencies and was coupled with a GPS positioning system.

The first stage in the search consisted of checking signal transmissions and defining an general area using the omni-directional antenna. The seafloor being uncharted at that time, locating the beacons was complicated by possible reflections from the transmitted sound waves and possible secondary echoes. The next stage consisted of taking successive bearings using the directional antenna so to get a more precise fix.

This acoustic search determined two possible positions for the beacons: one to the south with a position considered as nominal since it could be picked up from all bearings, but which was transmitting more weakly than the one identified further north. The measurements and calculations performed gave an estimated depth of around one thousand meters.

To confirm these results, the USBL (ultra short base line - acoustic positioning) of the *Ile de Batz* (the first recovery ship on site) was later temporarily modified (in coordination with its manufacturer Sonardyne) and adapted to the reception of the signals transmitted by the southern pinger. These results confirmed the presence of a transmission source beneath the *Ile de Batz* which had been positioned directly above the estimated position.

To narrow the search area, the French Navy contracted ACSA to supply a GIB system (GPS Intelligent Buoys). They adapted a network of four acoustic receivers, combined with GPS information, to conduct a search at a depth of around one thousand meters .

The hydrophones, immersed 450 meters down around the initial identified position, drifted with the current while permanently transmitting information on their position and any signals received. An algorithm integrated all data to determine the recorder's fixed position.

The ROV started searching for the recorders using its cameras based on an initial determination of the position of its beacon. This position was then refined by the ACSA system. That produced a theoretical position with a precision of plus or minus ten meters over one hundred meters.

Squares of twenty by twenty meters were systematically searched by the ROV.

The FDR was discovered on 16th January 2004 approximately twelve meters from the computed position.

On the basis of the initial analysis of wreckage distribution, it was decided to define a zone to the south of the position of the FDR. The CVR was found on 17th January 2004 in a nearby traced square.

Operations Group Field Report

January 22, 2004

Group Chairman's Field Report

OPERATIONS

1. ACCIDENT

Operator: Flash Airlines
Location: Sharm-El-Sheikh, Egypt
Date: January 3, 2004
Time: 0246 UTC¹
Airplane: Boeing B-737-300, SU-ZCF, Serial Number 26283

2. SUMMARY

On January 3, 2004, about 02:45:06 UTC, 04:45:06 Local time, Flash Airlines flight FSH604, a Boeing 737-300, Egyptian registration SU-ZCF, crashed into the Red Sea shortly after takeoff from Sharm el-Sheikh International Airport (SSH) in South Sinai, Egypt. The flight was a passenger charter flight to Charles de Gaulle Airport (CDG), France with a stopover in Cairo international Airport (CAI) for refueling. Flight 604 departed from Sharm el-Sheikh airport with 2 pilots (Captain and First Officer), 1 observer, 4 cabin crew, 6 off-duty crew members and 135 passengers on board. The airplane was destroyed due to impact forces with the Red Sea with no survivals.

The airplane had departed from Sharm el-Sheikh runway 22R and was air born at 02:42:33 UTC, approximately 2½ minutes prior to the crash, and had been cleared for a climbing left turn intercept the 306 radial from the Sharm el-Sheikh VOR station located just north of runway 22R. This climbing turn allows departing flights to gain sufficient altitude before proceeding over higher terrain located along the flight path to Cairo. Flight 604 was operating in Egyptian airspace as a charter flight operating under the provisions of Egyptian Civil Aviation Regulations Part 121

3. DETAILS OF THE INVESTIGATION

The Operations group convened at 1100 on January 14, 2004 at the offices of the Ministry of Civil Aviation. An interview was conducted with the Chief Pilot of Flash Airlines regarding the pilot and co-pilot qualifications. Pilot training records were reviewed and information was collected to include medical and flying licenses and total flying time. A member of the operations group participated in the interview of the ground engineer that flew

¹ All times are Universal Coordinated Time based on a 24-hour clock, unless otherwise noted. Actual time of accident is approximate, to be determined by the correlation of the Flight Data Recorder (FDR) and Air Traffic Control (ATC) transcripts.

on the airplane prior to the accident flight. A review of the weight and balance of the flight was conducted. Activities were concluded on January 22, 2003.

3.1 AIRPORT INFORMATION

According to the Aeronautical Information Publication (AIP), Sharm El Sheikh International Airport was located 23 kilometers northeast of the city. The elevation of the airport was 143 feet mean sea level. The airport had two paved parallel runways; 04L-22R and 04R-22L. Both runways were 3081 meters in length and 45 meters in width. Runways 04R and 04L had CAT 1 Approach Lighting System and runways 22R and 22L had Simple Approach Lighting System. Neither runway had runway centerline lights.

According to the AIP Flight procedures, there was no standard departures and standard arrival routes or any other systematic procedures established within. Sharm El Sheikh approach airspace, heading, flight level, speed and or holding instructions shall be specified in approach control clearances to arriving and departing flights as appropriate to meet the requirements of traffic conditions.

3.2 FLIGHT CREW INFORMATION

Both flight crewmembers were certificated under Egyptian Civil Aviation Supervisory Sector Authority (ECASSA).

3.2.1 Captain Khedr Abdalla Saad Said

- Date of birth: February 26, 1950
- Date of hire with Flash Airlines: February 16, 2003
- Airline Transport Pilot Egyptian Certificate Number 561 (issued December 15, 1984)
 - Airplane Multiengine Land
 - Airplane Single Engine Land/Commercial Pilot
- Limitations: None
- Type Ratings: ATR-42, B-737/300/400/500 (issued May 27, 2003), DHC-5 Buffalo, C-130, Gornhorya.
 - Medical: First Class (issued November 19, 2003)
 - Limitations: None
 - Initial Ground School Training:
 - Written Test: April 9, 2003
 - Oral Test: May 22, 2003
 - Initial Simulator Training B-737-300/400/500: April 28 - May 12, 2003
 - Initial Proficiency Check B-737-300/400/500: May 12, 2003
 - Last Proficiency Check B-737-300/400/500: May 12, 2003
 - Last Line Check: July 23, 2003
 - Last Recurrent Training: December 16, 2003

- **FLIGHT TIMES:**

Total flight time (hrs/min) ² :	7,443:45
Total flight time on B-737:	474:15
Total flight time PIC:	5,473:35
Military Instructor Flight time:	1,967:55
Total flight time last 24 hours ³ :	7:15
Total flying time last 30 days:	83:51
Total flying Time 90 days:	244:43

3.2.2 First Officer Amr Mahmoud Shafie

- Date of birth: January 1, 1979
- Date of hire with Flash Airlines: May 22, 2002
- Egyptian Commercial Pilot License Number 3284 (issued April 12, 1997), Commercial Pilot License issued by the Federal Aviation Administration (FAA) Certificate Number 2546582 (issued July 31, 1996)
 - Airplane Multiengine Land
 - Airplane Single Engine Land/Commercial Pilot
 - Instrument Airplane
 - Private Privileges
- Limitations: None
- Type Ratings: CESSNA (ISSUED April, 12, 1997) I, B737-200 (ISSUED July, 22,1998) II, B737-300/400/500 (ISSUED July, 18, 2002) II
 - Medical: First Class (issued May 5, 2003)
 - Limitations: None
 - Initial Ground School Training:
 - Written Test: June 10, 2002
 - Oral Test: May 22, 2002
 - Initial Simulator Training_B-737-300/400/500: June 22 – June 30, 2002
 - Initial Proficiency Check B-737-300/400/500: June 30, 2002
 - Last Proficiency Check B-737-300/400/500: May 15, 2003
 - Last Line Check: July 11, 2002

² Times are calculated for the captain up until December 31, 2003.

³ Times do not include the accident flight.

- Last Recurrent Training: December 12, 2003
- FLIGHT TIMES:

Total flight time (hrs/min) ⁴ :	788:53
Total flight time B-737:	242:28
Total flying time last 24 hours ⁵ :	7:15
Total flying time last 30 days:	43:45
Total flying Time 90 days:	61:10

3.3 WEIGHT AND BALANCE

The Flash Airlines weight and balance calculations provided to the flight crew contained the following information⁶:

	Weight (kilograms)
Total Traffic Load	11,450 ⁷
Dry Operating Mass	33,200
Actual Zero Fuel Mass	44,650
Maximum Zero Fuel Mass	47,627
Takeoff Fuel	7,000
Actual Takeoff Mass	51,650
Maximum Takeoff Mass (Certificate Limit)	63,276
Landing Mass	49,650
Maximum Landing Mass (Certificate Limit)	51,709

Zero Fuel Mass Center of Gravity (CG)	20.0%	
Zero Fuel Mass CG Limits ⁸	8.0% Forward	28.4% Aft
Takeoff Mass CG	18.0%	
Takeoff Mass CG Limits ⁹	6.7% Forward	27.9% Aft

⁴ Times are calculated for the first officer up until December 31, 2003.

⁵ Times do not include the accident flight.

⁶ See attached Flash Airlines Load and Trim Sheet.

⁷ A review of the Load and Trim Sheet indicated a low 100-kilogram error. The total cargo weight plus passenger mass (Total Traffic Load) should be 11,550 kilograms. Correspondingly, the Zero Fuel Mass, Takeoff Mass, and Landing Mass will be low in error by the same 100-kilogram Mass.

⁸ Estimated Zero Fuel Mass CG limits were derived from Flash Airlines Load and Trim sheet index chart based upon a Zero Fuel Mass of 44,650 kilograms.

⁹ Estimated Takeoff Mass CG limits were derived from Flash Airlines Load and Trim sheet index chart based upon a Takeoff Mass of 51,650 kilograms.

According to the Director, the prevailing winds at SSH require the use of runway 04L 70%-80% of the year. On the date of the accident, runway 04L was being used. However, sometime during the day prior to the accident, the runway was changed to 22R.

There was not an inspection of the runway after notification of the accident, however, it was stated that the landing airplane after the accident did not report debris on the runway. There is a daily runway inspection performed at SSH.

3.5 METEOROLOGY

Sharm El-Sheikh does not provide Automatic Terminal Information Service (ATIS).

The SSH weather at 0200Z was reported as:

270 degrees at 06 knots, Ceiling and visibility OK (CAVOK) temperature 17 degrees Celsius, dewpoint minus 6 degree Celsius, altimeter 1011 hectoPascals (hPa), No significant change (NOSIG).¹¹

The SSH weather at 0300Z was reported as:

280 degrees at 08 knots, Ceiling and visibility OK (CAVOK) temperature 17 degrees Celsius, dewpoint minus 6 degree Celsius, altimeter 1011 hectoPascals (hPa), No significant change (NOSIG).

¹¹ See attached weather reports for SSH.
